

**ADDENDUM TO THE CERTIFIED FINAL ENVIRONMENTAL IMPACT REPORT
FOR THE
SAN LUIS RANCH PROJECT**

JUNE 2018

A. INTRODUCTION

This document is an Addendum to the Final Environmental Impact Report (FEIR) prepared for the San Luis Ranch Project (State Clearinghouse Number 2015101083). The FEIR was certified by the City of San Luis Obispo on July 18, 2017, pursuant to City Council Resolution No. 10822 (2017 Series). The Addendum is intended to bring the existing CEQA documentation up to date as appropriate. Because there are no new significant impacts or mitigation measures as a result of this updated analysis, an Addendum is the appropriate CEQA document.

B. ADDENDUM REQUIREMENTS

The Addendum has been prepared in accordance with the relevant provisions of the California Environmental Quality Act (CEQA) of 1970 (as amended) and the State CEQA Guidelines as implemented by the SSLOCSD. According to §15164(b) of the State CEQA Guidelines, an Addendum to an Environmental Impact Report (EIR) is the appropriate environmental document in instances when “only minor technical changes or additions are necessary or none of the conditions described in Section 15162 calling for the preparation of a subsequent EIR have occurred”. Section 15162(a) of the State CEQA Guidelines states that no subsequent Negative Declaration shall be prepared for a project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:

(1) Substantial changes are proposed in the project which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

(2) Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

(3) New information of substantial importance, which was not known and could

not have been known with the exercise of reasonable diligence at the time the previous EIR or Negative Declaration was adopted, shows any of the following:

(A) The project will have one or more significant effects not discussed in the previous EIR or Negative Declaration;

(B) Significant effects previously examined will be substantially more severe than shown in the previous EIR or Negative Declaration;

(C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

(D) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR or Negative Declaration would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

This Addendum does not require circulation because it does not provide significant new information that changes the certified FEIR in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect.

This Addendum includes this introduction and a description of the proposed actions addressed in the Addendum as they related to the previously-approved project. The technical analysis in support of this Addendum is included as an appendix to this document for reference (**Appendix A**).

The City shall consider this Addendum with the certified Final EIR as part of the approval of the updated project.

The CEQA documentation for this project, including this Addendum and certified FEIR, is available for review at City Hall, located at 990 Palm Street, San Luis Obispo, California. It is also available on the City's website at www.slocity.org.

C. PREVIOUS CEQA DOCUMENTATION

The City Council unanimously certified a Final EIR and approved the project on July 18, 2017, pursuant to City Council Resolution No. 10822 (2017 Series). A Notice of Determination (NOD) was prepared, and there were no legal challenges to the adequacy of the Final EIR during the 30-day statute of limitations associated with the NOD, pursuant to CEQA (PRC Section 21167 and CEQA Guidelines Section 15094).

D. REASONS WHY AN ADDENDUM IS APPROPRIATE

Subsequent to the approval of the San Luis Ranch project in July 2017, the City of San Luis Obispo conducted additional analysis of traffic operations along the U.S. Highway 101 corridor in the vicinity of Prado Road as a part of on-going work for the *US 101/ Prado Road Interchange Project. The Study Report-Project Development Support (PSR-PDS)* approved by Caltrans in April 2018 and the Project Approval – Environmental Determination (PAED) for the interchange is currently underway. This Addendum incorporates the additional analysis for inclusion in the environmental record. The updated analysis does not materially change the findings and conclusions of the FEIR, making a Subsequent EIR unnecessary pursuant to Section 15162 of the CEQA guidelines.

E. UPDATED PROJECT ELEMENTS

The setting and project description for the purpose of the updated traffic report remain unchanged from those included in the certified Final EIR. Please refer to that document for setting information related to analyzing project impacts.

F. UPDATED ENVIRONMENTAL IMPACT ANALYSIS

This section addresses transportation-related information that has been prepared since the FEIR was certified in July 2017. Except as noted below, none of the analysis or discussion included in the certified FEIR has changed. None of the conclusions, including required mitigation measures, change as a result of this updated analysis.

Updated Analysis

Several commenters on the Draft EIR raised questions and concerns regarding construction of the Prado Road Overcrossing with Northbound US 101 Ramps (Mitigation Measures T-1, T-2, and T-3). Master Response 2 of the FEIR describes the analysis of the Prado Road Overcrossing/ Interchange in detail. In April 2018, after FEIR certification, Caltrans approved the US 101/ Prado Road Interchange Project Study Report-Project Development Support (PSR-PDS) which identifies and evaluates viable build alternatives for the interchange. Operational results in the *San Luis Ranch Specific Plan Multimodal Transportation Impact Study Addendum (TIS Addendum, 2018)* prepared by Omni-Means, a GHD Company is included as **Appendix A** to this Addendum.

The Supplemental TIS describes traffic operations for mainline, ramp merge and diverge, and weaving sections along US 101 from south of the Los Osos Valley Road interchange to north of the Marsh Street interchange. It reports existing, near term (2025), and cumulative (2035) conditions both with and without the San Luis Ranch project.

The Supplemental TIS concludes that *“This updated analysis does not materially change the findings and conclusions of the May 2017 San Luis Ranch Specific Plan Multimodal Transportation Impact Study.”* The referenced May 2017 study was the primary source document for the FEIR.

G. DETERMINATION

In accordance with Section 15164 of the CEQA Guidelines, the City of San Luis Obispo (City) has determined that this Addendum to the certified FEIR is necessary to document changes or additions that have occurred in the project description since the FEIR was originally certified. The City has reviewed and considered the information contained in this Addendum and finds that the preparation of subsequent CEQA analysis that would require public circulation is not necessary.

Introduction

The City of San Luis Obispo retained Omni-Means, A GHD Company, to perform a Multimodal Transportation Impact Study (TIS) for the proposed San Luis Ranch Specific Plan. The proposed mixed-use development is located on a 131.3-acre site in unincorporated San Luis Obispo County, adjacent to the City of San Luis Obispo, and within the City's Sphere of Influence (SOI). The site is generally bounded by Madonna Road, Dalidio Drive, and US Highway 101. The site is part of an agricultural reserve that has historically been used as farmland. Figure 1 presents the study area and vicinity map. Consistent with the requirements of the General Plan, the San Luis Ranch Specific Plan must be adopted by the City Council prior to annexation of the Plan Area. The City would annex the Plan Area with project approval. The San Luis Ranch Specific Plan is proposing a mix of residential, commercial, hotel, and office uses while preserving substantial areas of open and agricultural space. Figure 1 presents the study area and vicinity map.

The final *San Luis Ranch Specific Plan Multimodal Transportation Impact Study (May 2017) (Final TIS)* evaluated the proposed 580-Unit Alternative of the San Luis Ranch Specific Plan to determine any operational or safety impacts to the surrounding infrastructure. This *San Luis Ranch Specific Plan Supplemental Multimodal Transportation Impact Study (Supplemental TIS)* presents the projected transportation operations and impacts to US 101 mainline, ramp junctions (merge and diverge) and weaving segments associated with development of the project under *Existing, Near Term, and Cumulative Conditions* for vehicular related impacts, and the mitigation measures required to mitigate impacts to less than significant.

In the adopted EIR, mainline Level of Service (LOS) was provided and merge, diverge, & weave analysis was included by referenced in the response to comments, since then this technical analysis has been updated as part of on-going work for the Prado Road Interchange project therefore this Supplemental TIS is recommended to be included in the EIR record. This updated analysis does not materially change the findings and conclusions of the May 2017 San Luis Ranch Specific Plan Multimodal Transportation Impact Study.

Highway Segments

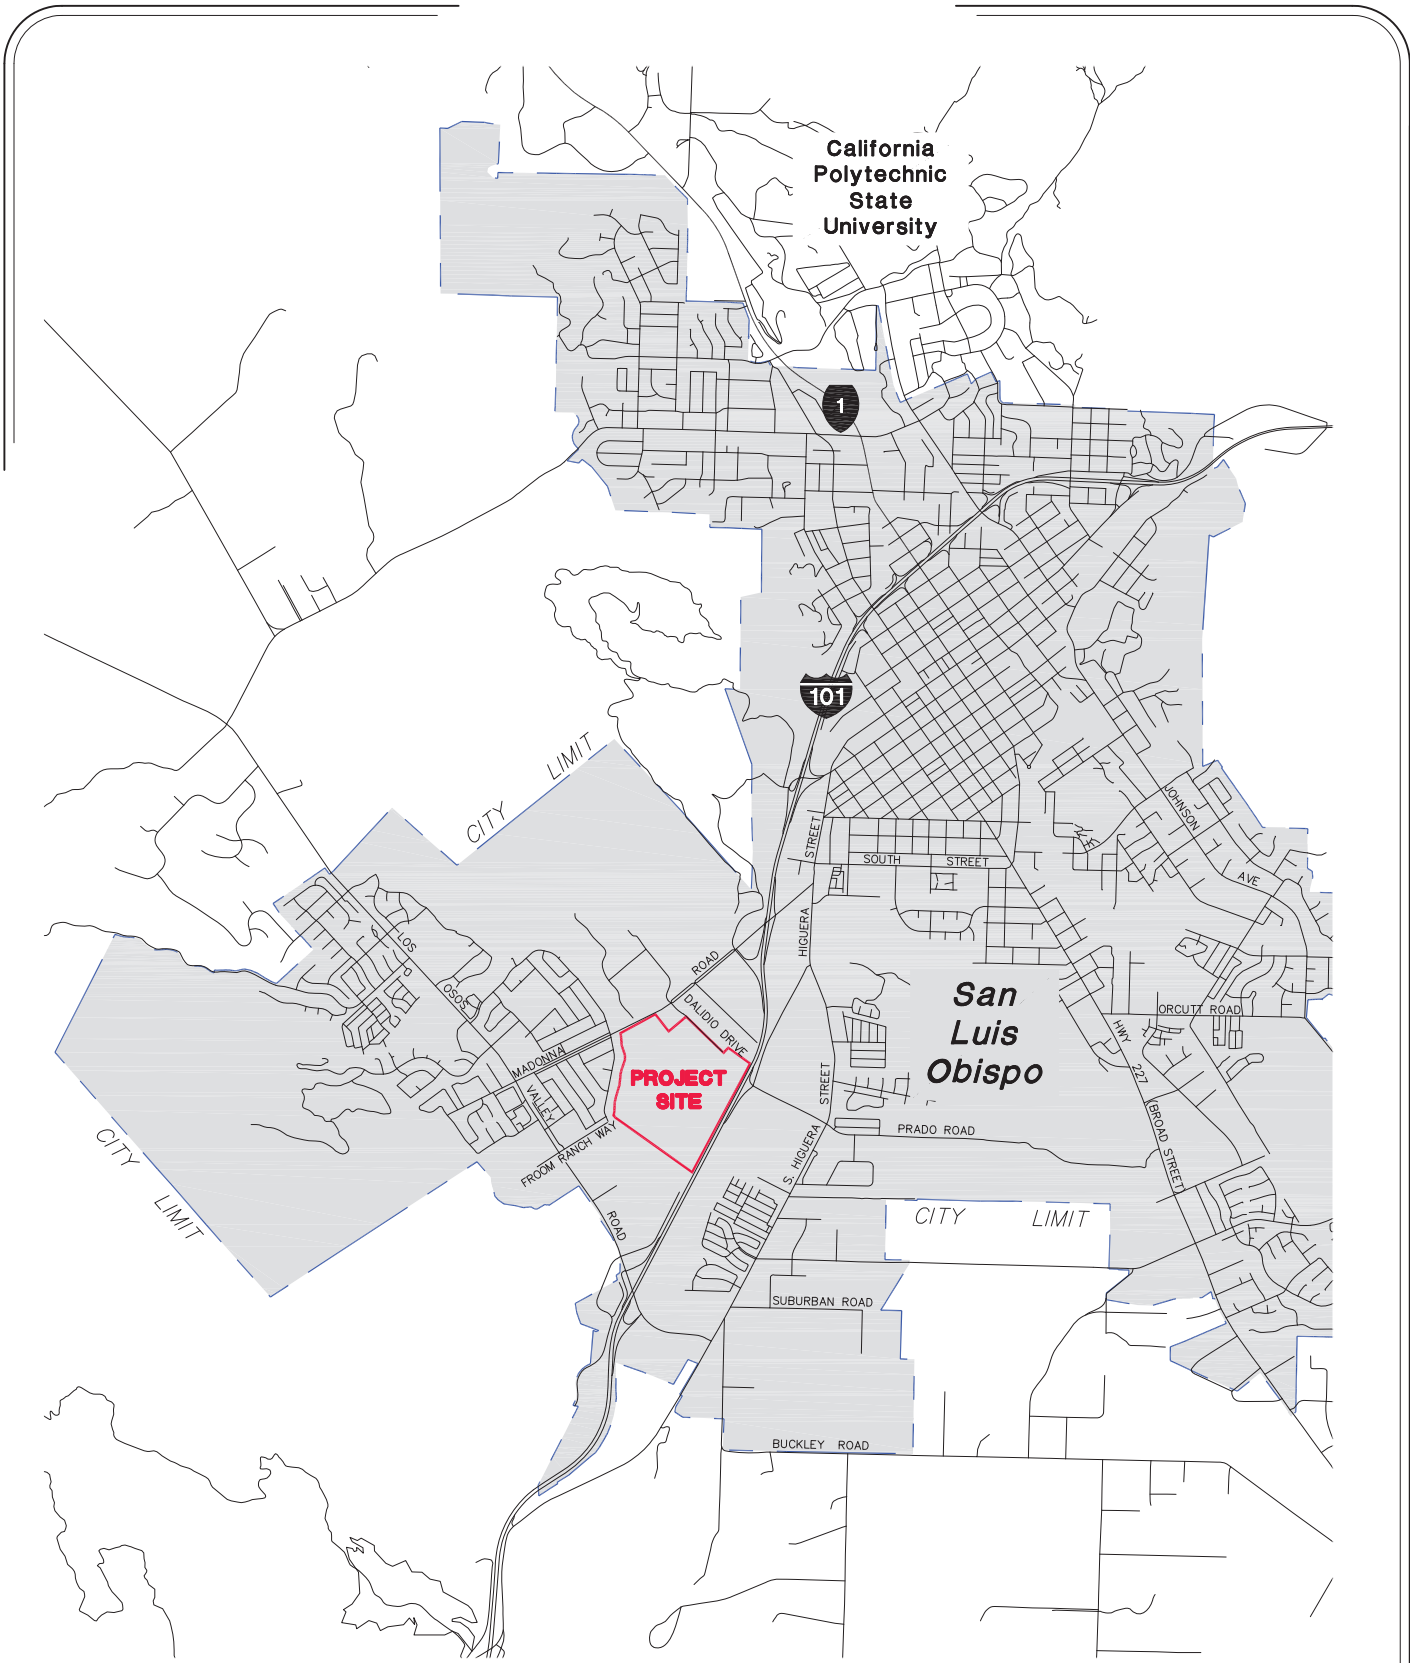

Four highway mainline segments and three interchanges have been identified by the City of San Luis Obispo and Caltrans for analysis. The mainline segments include:

1. US 101 South of Los Osos Valley Road
2. US 101 between Los Osos Valley Road and Prado Road
3. US 101 between Prado Road and Madonna Road
4. US 101 between Madonna Road and Marsh Street

The interchanges include:

1. US 101 / Los Osos Valley Road
2. US 101 / Prado Road
3. US 101 / Madonna Road

The study locations above were analyzed for weekday AM and PM peak hours for mainline, ramp merge and diverge and weave segments using vehicular counts obtained either from the City's on-line traffic counts database or from Caltrans Performance Measurement System (PeMS).

San Luis Ranch Specific Plan Multimodal TIS

Figure 1

Study Area Map

The following traffic scenarios were analyzed as part of this study:

- Existing Conditions
- Existing Plus Project Conditions
- Near Term (Year 2025) Conditions
- Near Term Plus Project Conditions
- Cumulative (Year 2035) Full Build Prado Road Interchange Conditions
- Cumulative Full Build Prado Road Interchange Plus Project Conditions
- Cumulative (Year 2035) Prado Road Overcrossing Conditions
- Cumulative Prado Road Overcrossing Plus Project Conditions

Existing conditions establishes the baseline conditions for the year 2014 traffic operations, when the City traffic counts were collected, at the study locations. Existing Plus Project conditions is an analysis scenario in which project-related traffic impacts are examined in comparison to the Existing conditions. The Near Term conditions is an analysis scenario in which the City's approved, pending and potential land development projects are assumed to be in place, in roughly 10 years (Year 2025). The Near Term Plus Project conditions is an analysis scenario in which project-related traffic impacts are examined in comparison to the Near Term conditions.

Cumulative conditions establish the conditions that would exist at build-out of the City's General Plan, representing approximately twenty years out (Year 2035). Cumulative Plus Project conditions is an analysis scenario in which project-related traffic impacts are examined in comparison to Cumulative conditions. Two cumulative scenarios have been included in this study. The Cumulative Full Build Prado Road Interchange analysis scenarios consider a full access diamond interchange to be constructed at Prado Road, in addition to all other City roadway improvements. The Cumulative Year 2035 Prado Road Overcrossing scenarios consider an overcrossing to be constructed over US 101 connecting Prado Road to Dalidio Drive and the existing US 101 Northbound ramps to be removed, in addition to all other City roadway improvements in place. In both cumulative scenarios, improvements to the City's transportation infrastructure system are assumed to be constructed, consistent with the General Plan Circulation.

Multimodal Analysis Methodology and Technical Parameters

The following section outlines the analysis methodology and technical parameters used to quantify US 101 mainline, ramp merge and diverge, and weave operations for vehicular traffic in this Supplemental TIS.

Applicable Level of Service Policies

Caltrans Policy

Caltrans has established the measure of effectiveness (MOE) for the evaluation of impacts in CEQA level projects on State facilities. Caltrans' Guide for the Preparation of Traffic Impact Studies (December 2002) contains the following policy pertaining to the LOS standards within Caltrans jurisdiction:

The Level of Service (LOS) for operating State highway facilities is based upon measures of effectiveness (MOEs). These MOEs describe the measures best suited for analyzing State highway facilities (i.e., freeway segments, signalized intersections, on- or off-ramps, etc.) Caltrans endeavors to maintain a target LOS at the transition between LOS "C" and LOS "D" on State highway facilities, however, Caltrans acknowledges that this may not always be feasible and recommends that the lead agency consult with Caltrans to determine the appropriate target LOS. If an existing State highway facility is operating at less than the appropriate target LOS, the existing MOE should be maintained.

Consistent with Caltrans policy and the LOS threshold identified in the final *San Luis Ranch Specific Plan Multimodal Transportation Impact Study (May 2017)*, this supplemental study considers LOS D as the standard acceptable threshold for State highway facilities.

Significance Thresholds

Caltrans Significance Threshold

Based on standard industry practice, the project is considered to have a significant impact if it would:

- Result in a facility that will operate at an acceptable LOS in the *No Project* condition to deteriorate to an unacceptable LOS in the *Plus Project* condition; or,
- Increase the density by more than 5% at a facility that will operate at an unacceptable LOS.

Table 1 presents the LOS thresholds for the basic freeway segments.

**TABLE 1:
BASIC FREEWAY SEGMENTS LOS CRITERIA**

| Segment Type | Density (pc/mi/ln) | | | | |
|--------------|--------------------|----|----|----|----|
| | A | B | C | D | E |
| Freeway | 11 | 18 | 26 | 35 | 45 |
| Merge | 10 | 20 | 28 | 35 | 45 |
| Diverge | 10 | 20 | 28 | 35 | 45 |
| Weave | 10 | 20 | 28 | 35 | 45 |

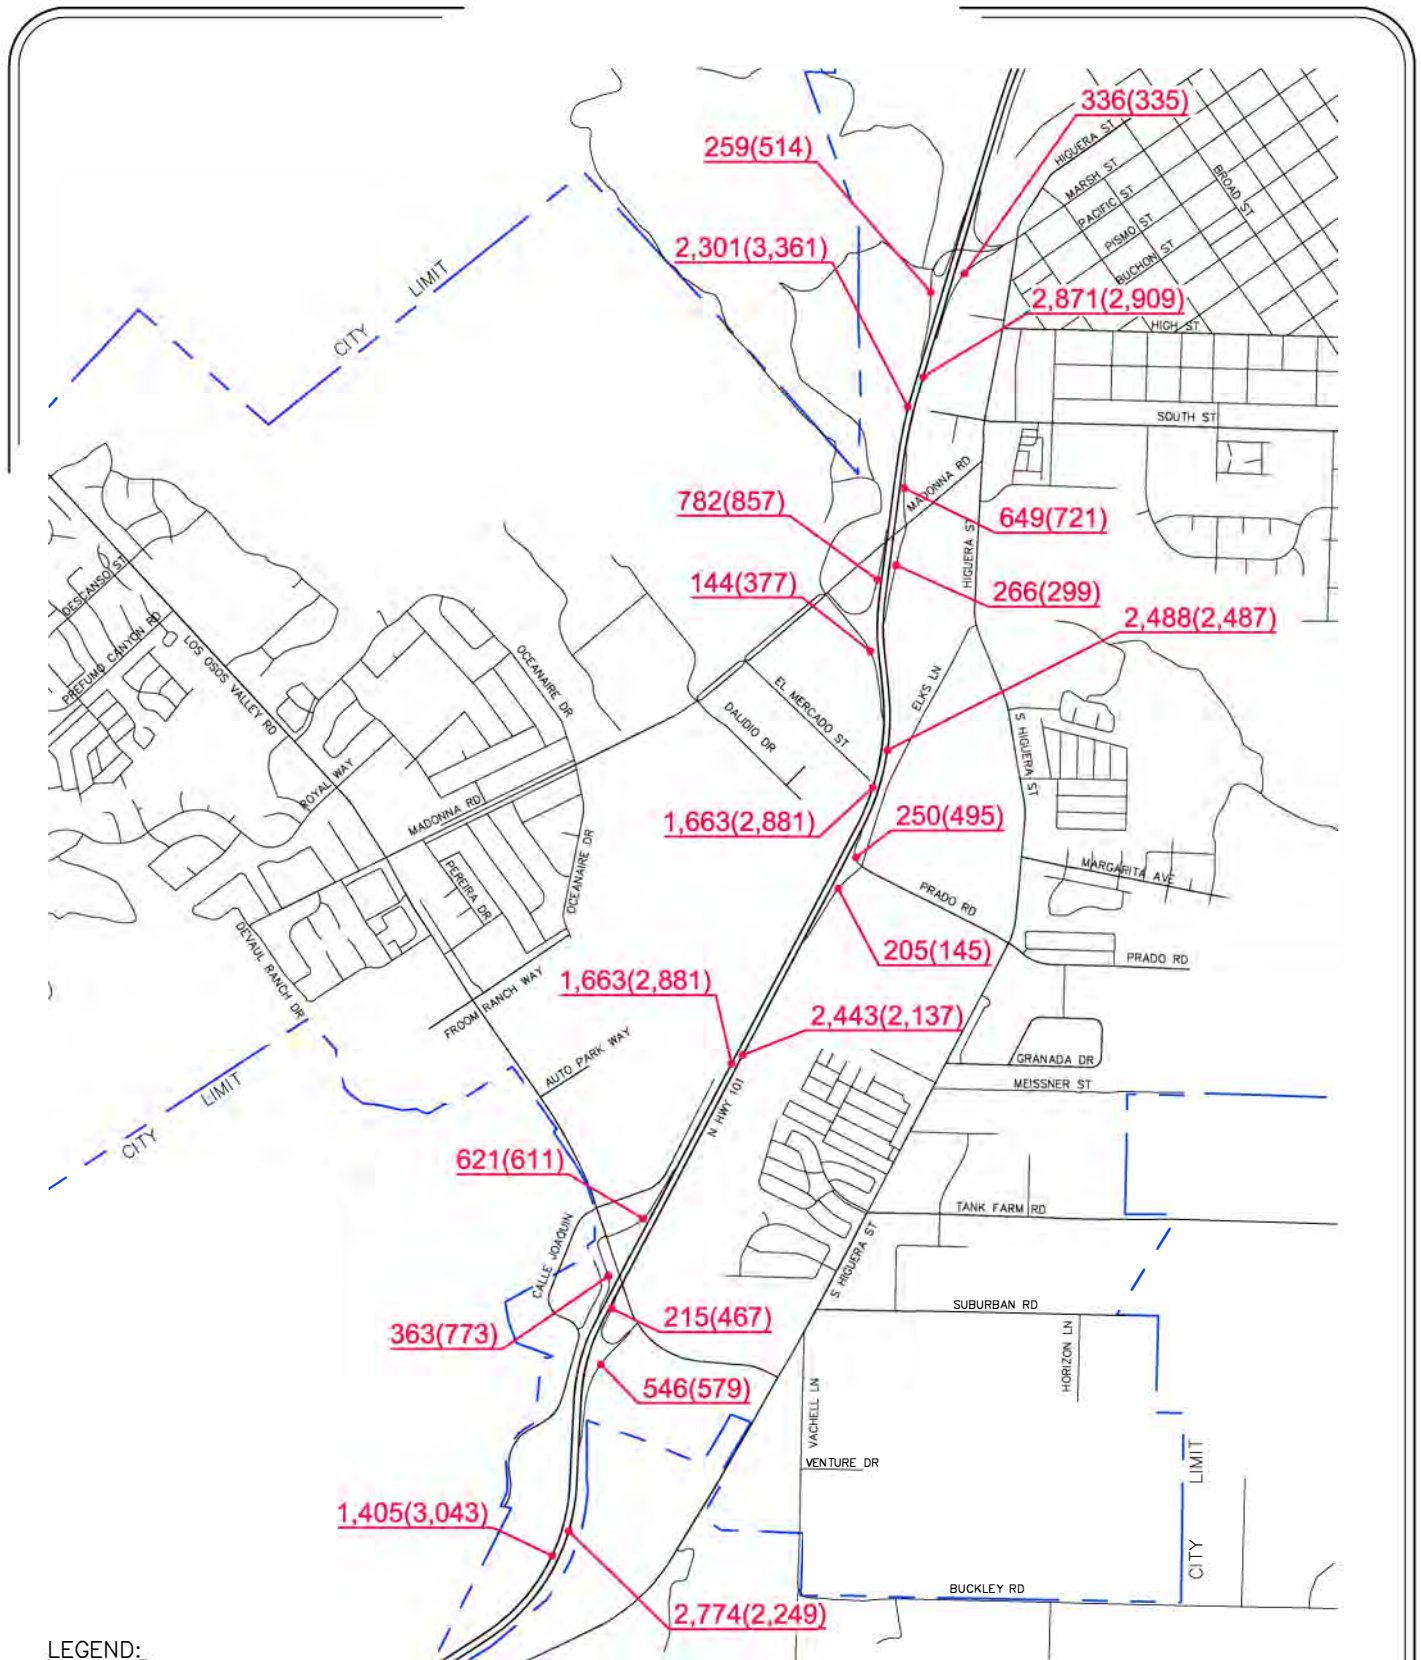

Notes: 1. Based on *Highway Capacity Manual, Fifth Edition*, Transportation Research Board, 2010.

Technical Analysis Parameters

The Transportation Research Board Publication *Highway Capacity Manual, Fifth Edition, 2010* (HCM 2010) methodologies for basic freeway segments, ramp junctions and weaving sections were implemented using Highway Capacity Software (*HCS 2010, McTrans*). Weaving section operations are also evaluated using the Leisch Method.

Existing Conditions

Existing conditions establish baseline traffic conditions that currently exist on US 101 mainline, the individual ramp junctions (merge and diverge), and within weaving segments within the study area. Figure 2 presents the existing peak hour volumes.

LEGEND:
 xx — AM PEAK HOUR TRAFFIC VOLUMES
 (xx) — PM PEAK HOUR TRAFFIC VOLUMES

SAN LUIS RANCH SPECIFIC PLAN MULTIMODAL TIS

Figure 2

Existing US 101 Peak Hour Traffic Volumes

Existing Conditions Analysis

Table 2 provides a summary of the existing US 101 mainline, ramp junction and weaving section operations during the AM and PM peak hour conditions. As shown in the table, all US 101 mainline, ramp merge and diverge, and weave sections currently operate at LOS D or better during both the AM and PM peak hours.

**TABLE 2:
EXISTING CONDITIONS MAINLINE, RAMPS & WEAVING SECTIONS – HCS 2010 ANALYSIS**

| Interchange Location | Segment Type | No. of Lanes | AM Peak Hour | | | PM Peak Hour | | |
|---|--------------|--------------|--------------|--------------------|----------|--------------|--------------------|----------|
| | | | Volume | Density (pc/mi/ln) | LOS | Volume | Density (pc/mi/ln) | LOS |
| US 101 Northbound | | | | | | | | |
| US 101 NB South of Los Osos Valley Road | Freeway | 2 | 2,774 | 24.5 | C | 2,249 | 19.7 | C |
| US 101 NB Los Osos Valley Road Off Ramp | Diverge | 1 | 546 | 29.4 | D | 579 | 24.3 | C |
| US 101 NB Los Osos Valley Road On Ramp | Merge | 1 | 215 | 23.2 | C | 467 | 20.4 | C |
| US 101 NB South of Prado Road | Freeway | 2 | 2,443 | 21.4 | C | 2,137 | 18.8 | C |
| US 101 NB Prado Road Off Ramp | Diverge | 1 | 205 | 26.7 | C | 145 | 23.7 | C |
| US 101 NB South of Madonna Road | Weave | 2 | 2,779 | 23.8 | C | 2,778 | 23.8 | C |
| US 101 NB South of Marsh Street | Weave | 3 | 3,207 | 17.9 | B | 3,251 | 18.2 | B |
| US 101 Southbound | | | | | | | | |
| US 101 SB South of Marsh Street | Weave | 3 | 2,570 | 14.2 | B | 3,754 | 21.3 | C |
| US 101 SB Madonna Road On Ramp | Merge | 1 | 144 | 14.6 | B | 377 | 25.3 | C |
| US 101 SB South of Madonna Road | Freeway | 2 | 1,663 | 14.6 | B | 2,881 | 25.6 | C |
| US 101 SB Los Osos Valley Road Off Ramp | Diverge | 1 | 621 | 15.8 | B | 611 | 27.8 | C |
| US 101 SB Los Osos Valley Road On Ramp | Merge | 1 | 363 | 15.3 | B | 773 | 29.7 | D |
| US 101 SB South of Los Osos Valley Road | Freeway | 2 | 1,405 | 12.3 | B | 3,043 | 27.4 | D |

There are three existing weaving sections, between the NB on-ramp from Prado Road and the off-ramp to Madonna Road, the northbound (NB) on-ramp from Madonna Road and the off-ramp to Marsh Street, and between the southbound (SB) on-ramp from Marsh Street and the off-ramp to Madonna Road. Caltrans noted that, though an auxiliary lane currently does not exist on NB US 101 between Prado Road and Madonna Road, this segment essentially operates as a weaving section and should be evaluated as such. Table 2 shows that each weaving section currently experiences LOS D or better operations during both the AM and PM peak hours.

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 3. As shown in this table, the NB weave between Prado Road and Madonna Road currently operates at LOS D/E during both the AM and PM peak hours.

**TABLE 3:
EXISTING CONDITIONS WEAVING SECTIONS – LEISCH METHOD**

| Interchange Location | Segment Type | No. of Lanes | AM Peak Hour | | | PM Peak Hour | | |
|---------------------------------|--------------|--------------|--------------|--------------|------------|--------------|--------------|------------|
| | | | Length | Total Volume | LOS | Length | Total Volume | LOS |
| US 101 Northbound | | | | | | | | |
| US 101 NB North of Prado Road | Weave | 2 | 2,140 | 2,779 | D/E | 2,140 | 2,778 | D/E |
| US 101 NB North of Madonna Road | Weave | 3 | 1,330 | 3,207 | C | 1,330 | 3,251 | C |
| US 101 Southbound | | | | | | | | |
| US 101 SB South of Marsh Street | Weave | 3 | 2,065 | 2,570 | B/C | 2,065 | 3,754 | D |

Existing Plus Project Conditions

The Existing Plus Project conditions include development of the proposed San Luis Ranch Specific Plan per the “Project Description” provided in the Final TIS. The Final TIS also provided the estimated project trip generation and trip distribution to the study area intersections, roadway segments and mainline US 101. Figure 3 presents the Existing Plus Project conditions peak hour volumes on US 101 mainline, the ramp junctions and within the weaving segments based on information provided in the Final TIS.

Existing Plus Project Conditions Analysis

Table 4 provides a summary of the Existing Plus Project conditions US 101 mainline, ramp junction and weaving section operations during the AM and PM peak hour conditions. As shown in the table, all US 101 mainline, ramp merge and diverge, and weave sections are projected to operate at LOS D or better during both the AM and PM peak hours.

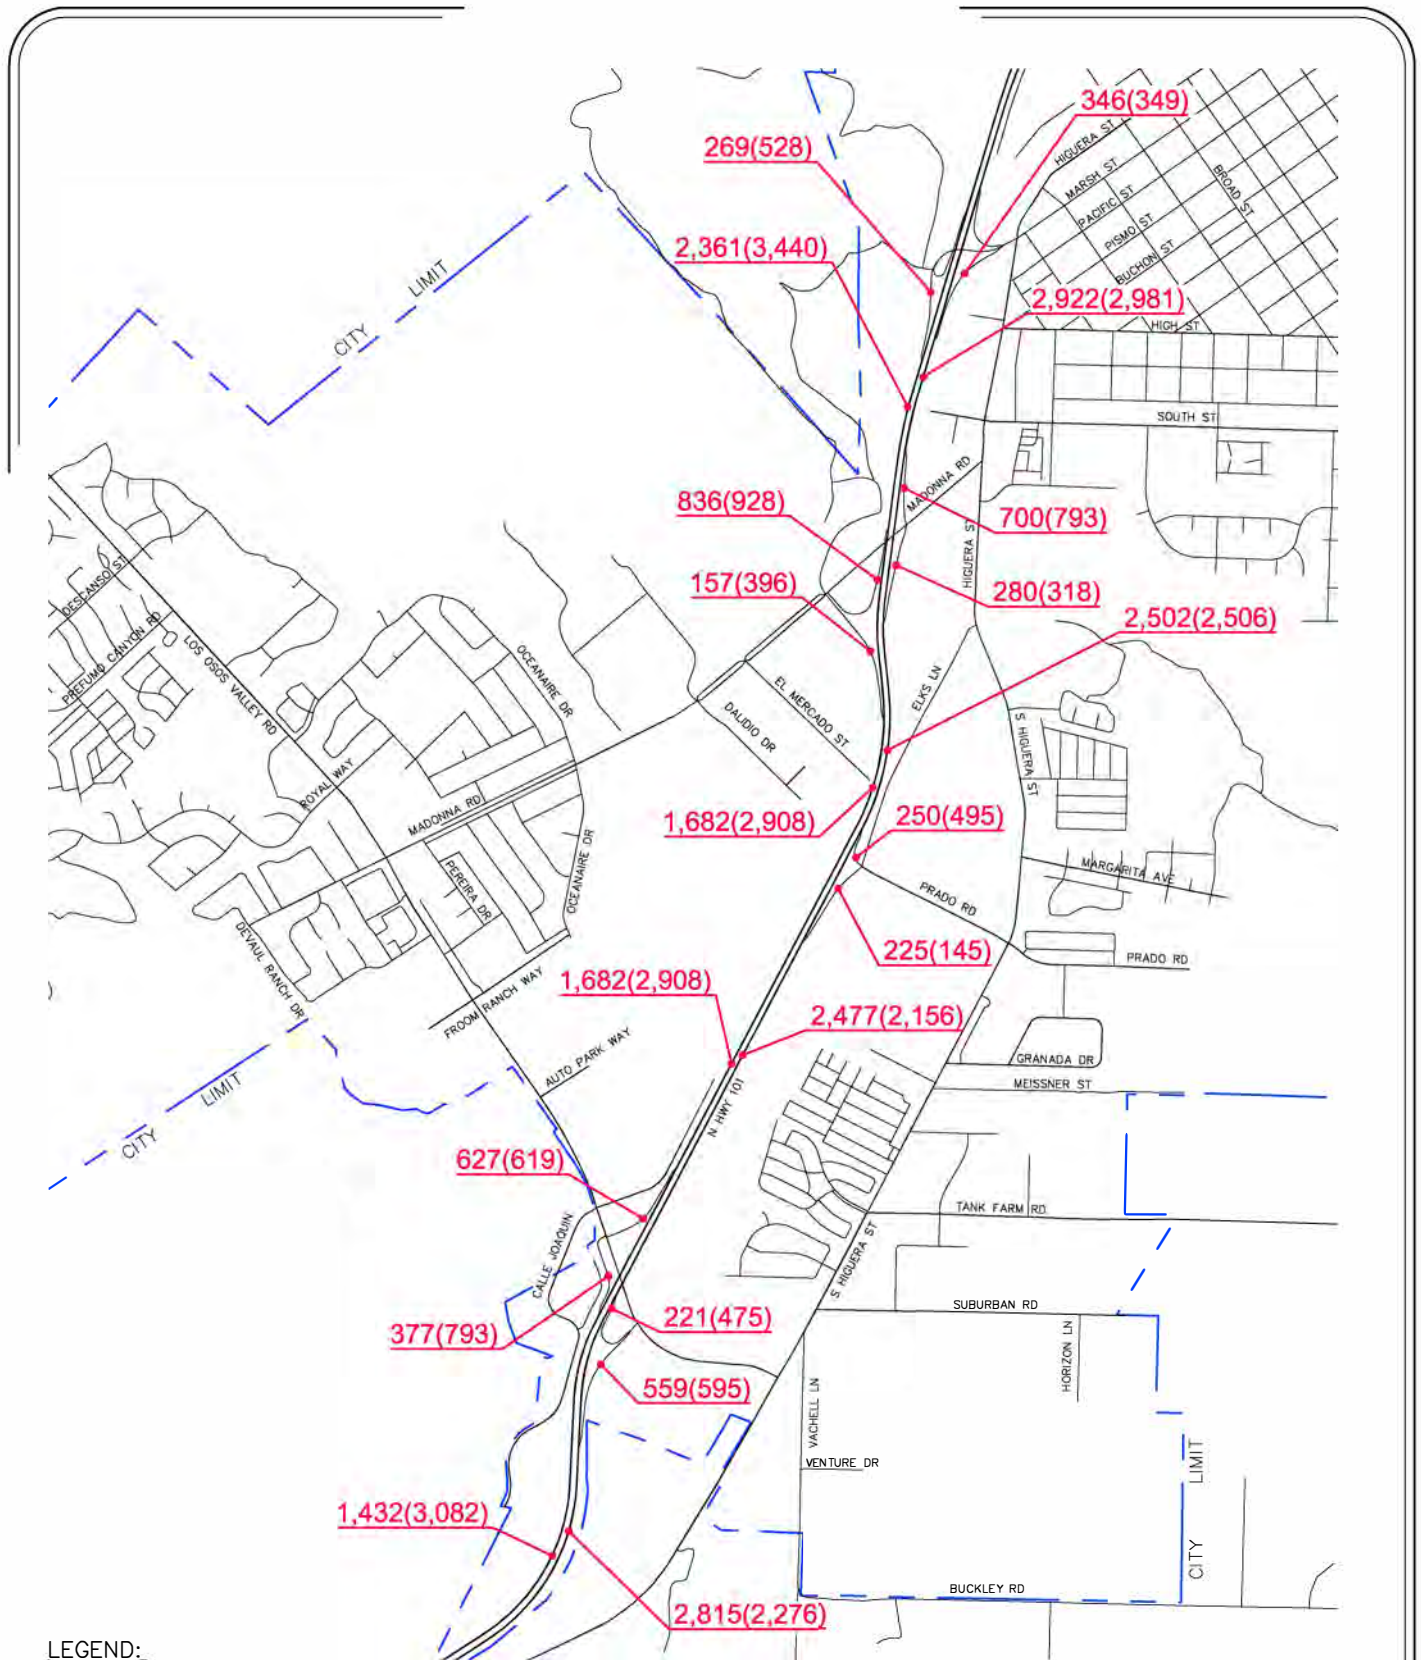

**TABLE 4:
EXISTING PLUS PROJECT CONDITIONS MAINLINE, RAMPS & WEAVING SECTIONS – HCS 2010 ANALYSIS**

| Interchange Location | Segment Type | No. of Lanes | AM Peak Hour | | | PM Peak Hour | | |
|---|--------------|--------------|--------------|--------------------|----------|--------------|--------------------|----------|
| | | | Volume | Density (pc/mi/ln) | LOS | Volume | Density (pc/mi/ln) | LOS |
| US 101 Northbound | | | | | | | | |
| US 101 NB South of Los Osos Valley Road | Freeway | 2 | 2,815 | 24.9 | C | 2,276 | 20.0 | C |
| US 101 NB Los Osos Valley Road Off Ramp | Diverge | 1 | 559 | 29.8 | D | 595 | 24.5 | C |

| US 101 SB South of Madonna Road | Freeway | 2 | 1,682 | 14.8 | B | 2,908 | 25.9 | C |
| US 101 SB Los Osos Valley Road Off Ramp | Diverge | 1 | 627 | 16.0 | B | 619 | 28.0 | D |
| US 101 SB Los Osos Valley Road On Ramp | Merge | 1 | 377 | 15.5 | B | 793 | 30.0 | D |
| US 101 SB South of Los Osos Valley Road | Freeway | 2 | 1,432 | 12.6 | B | 3,082 | 27.8 | D |

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 5. As shown in this table, the NB weave between Prado Road and Madonna Road is projected to operate at LOS D/E during both the AM and PM peak hours. This is consistent with the current peak hour operations reported in Table 3.

**TABLE 5:

SAN LUIS RANCH SPECIFIC PLAN MULTIMODAL TIS

Figure 3

Existing Plus Project US 101 Peak Hour Traffic Volumes

Near Term (Year 2025) Conditions

The Near Term conditions is a scenario in which the City's approved, pending and potential land development projects are assumed to be in place. As noted in the Final TIS, based on direction from the City, a volume growth increment for all travel modes was developed for the 2025 conditions. Vehicular trips are determined utilizing the *Avila Ranch* study completed by Central Coast Transportation Consulting. The volume growth between the Avila Ranch's *Existing* volumes and the *Near Term Plus Project No Business Park* volumes were utilized as a baseline to estimate a growth increment which was added to the Existing volumes provided in the Final TIS. Roadway improvements assumed to be in place for the Near Term conditions are as follows:

- Los Osos Valley Road interchange improvements and widening to 4 Lanes between Calle Joaquin and S. Higuera Street with Class II Bike Lanes
- Prado Road widening to 4 lanes between US 101 and S. Higuera Street with Class II Bike Lanes and an additional westbound left turn lane at S. Higuera Street
- Horizon Lane extension between Avila Ranch and Suburban Drive
- Southbound left turn pocket at Prado Road/S. Higuera Street is extended 250' with addition of pedestrian countdown heads with audible/tactile pushbuttons.
- Buckley Road extension to S. Higuera Street

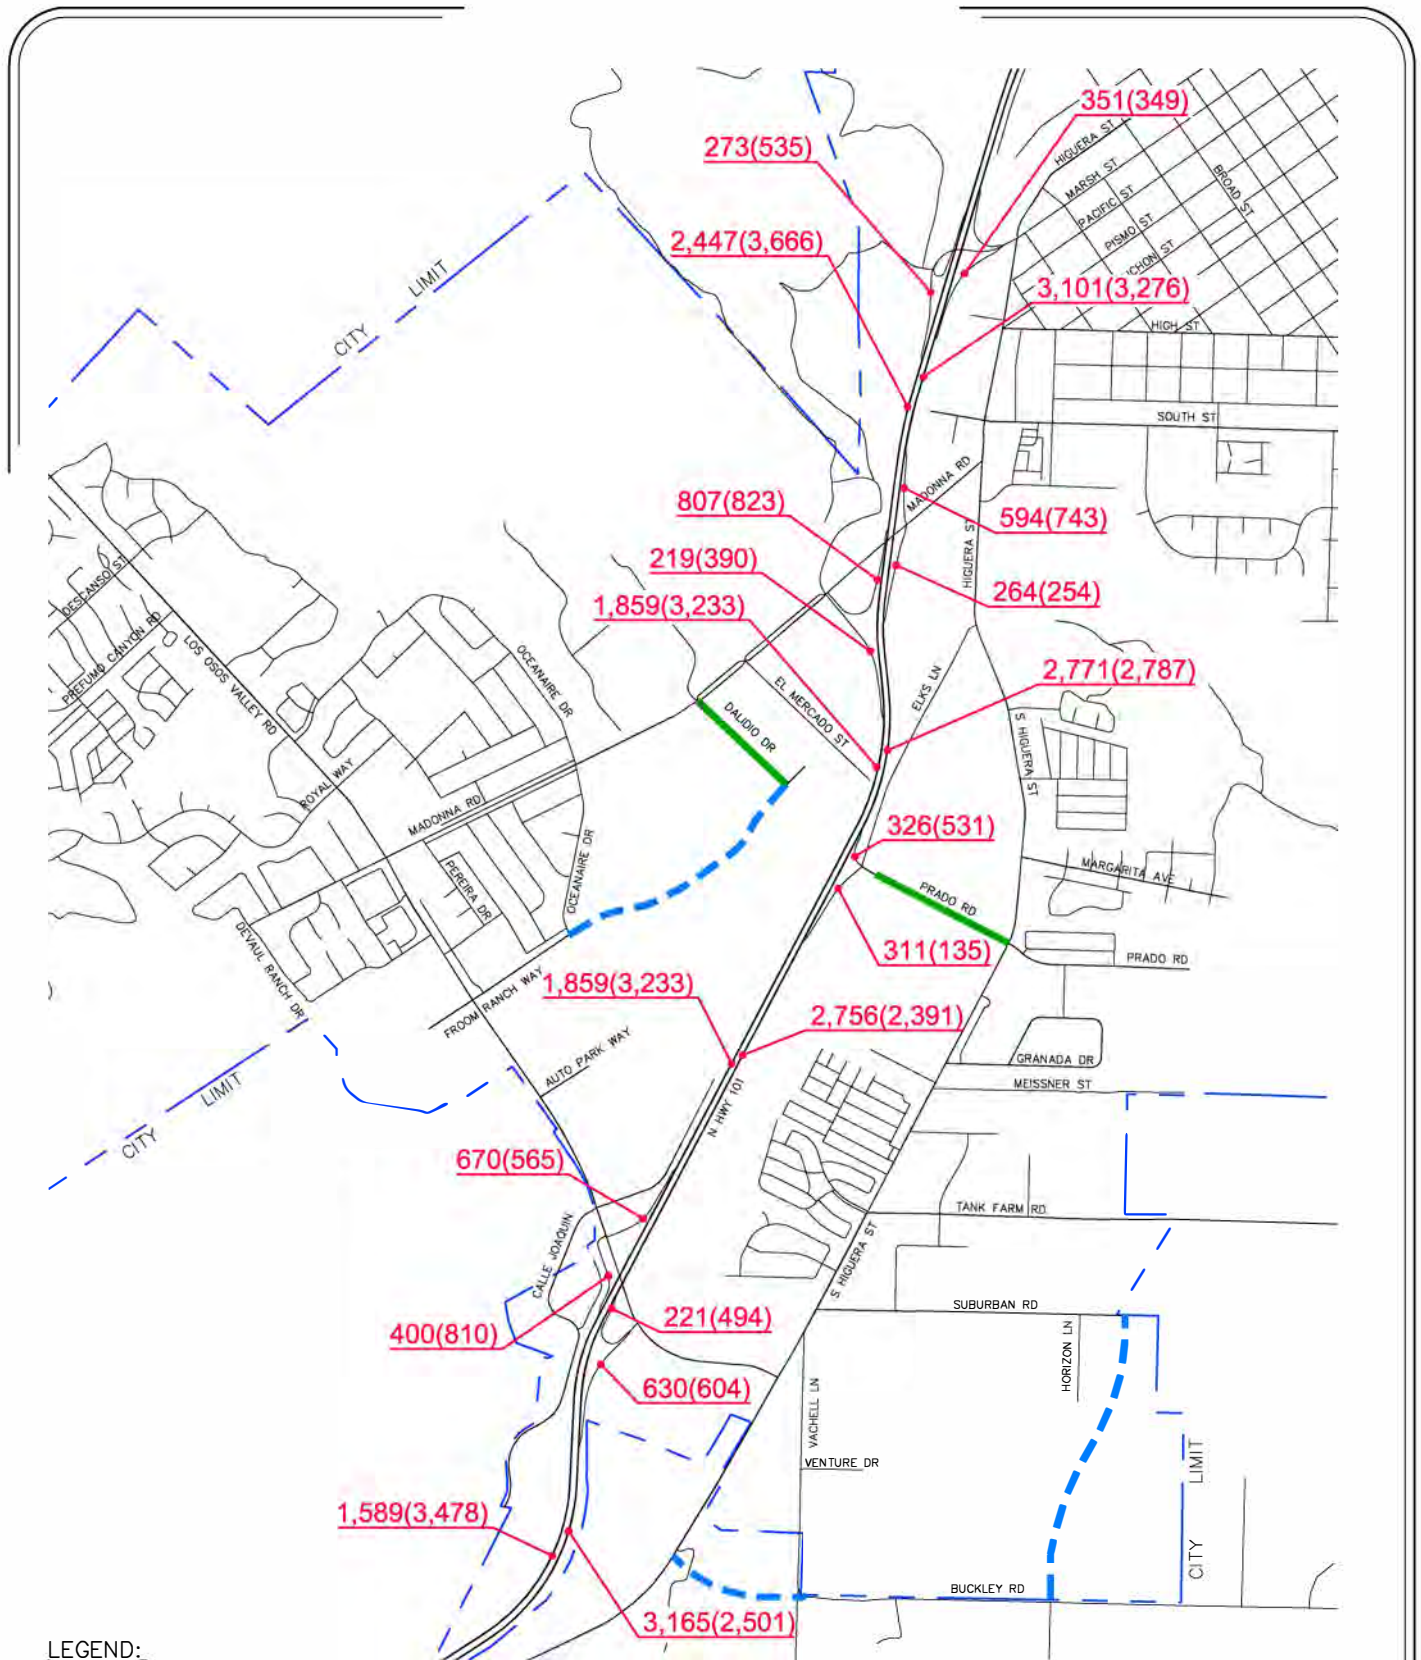

Figure 4 presents the Year 2025 Near Term US 101 mainline, ramp junctions, and weave sections peak hour traffic volumes assuming the above roadway improvements are in place, and with buildout of the Near Term Approved and Pending Projects reported in the Final TIS.

Near Term No Project Conditions Analysis

Table 6 provides a summary of the Near Term No Project conditions US 101 mainline, ramp junction and weaving section operations during the AM and PM peak hour conditions. As shown in the table, all US 101 mainline, ramp merge and diverge, and weave sections are projected to operate at LOS D or better during both the AM and PM peak hours.

Year 2025 Near Term US 101 Peak Hour Traffic Volumes

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 7. As shown in this table, the NB weave between Prado Road and Madonna Road is projected to operate at LOS E during both the AM and PM peak hours. Table 7 also shows that the SB weave between Marsh Street and Madonna Road is projected to operate at LOS E during the PM peak hour.

Figure 5

Year 2025 Near Term Plus Project US 101 Peak Hour Traffic Volumes

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 9. As shown in this table, the NB weave between Prado Road and Madonna Road is projected to operate at LOS E during both the AM and PM peak hours. This is consistent with the Near Term No Project conditions peak hour operations reported in Table 7. Table 9 also shows that the SB weave between Marsh Street and Madonna Road is projected to operate at LOS E during the PM peak hour. This is also consistent with the Near Term No Project conditions peak hour operations reported in Table 7.

Near Term Plus Project Impacts & Mitigation Measures

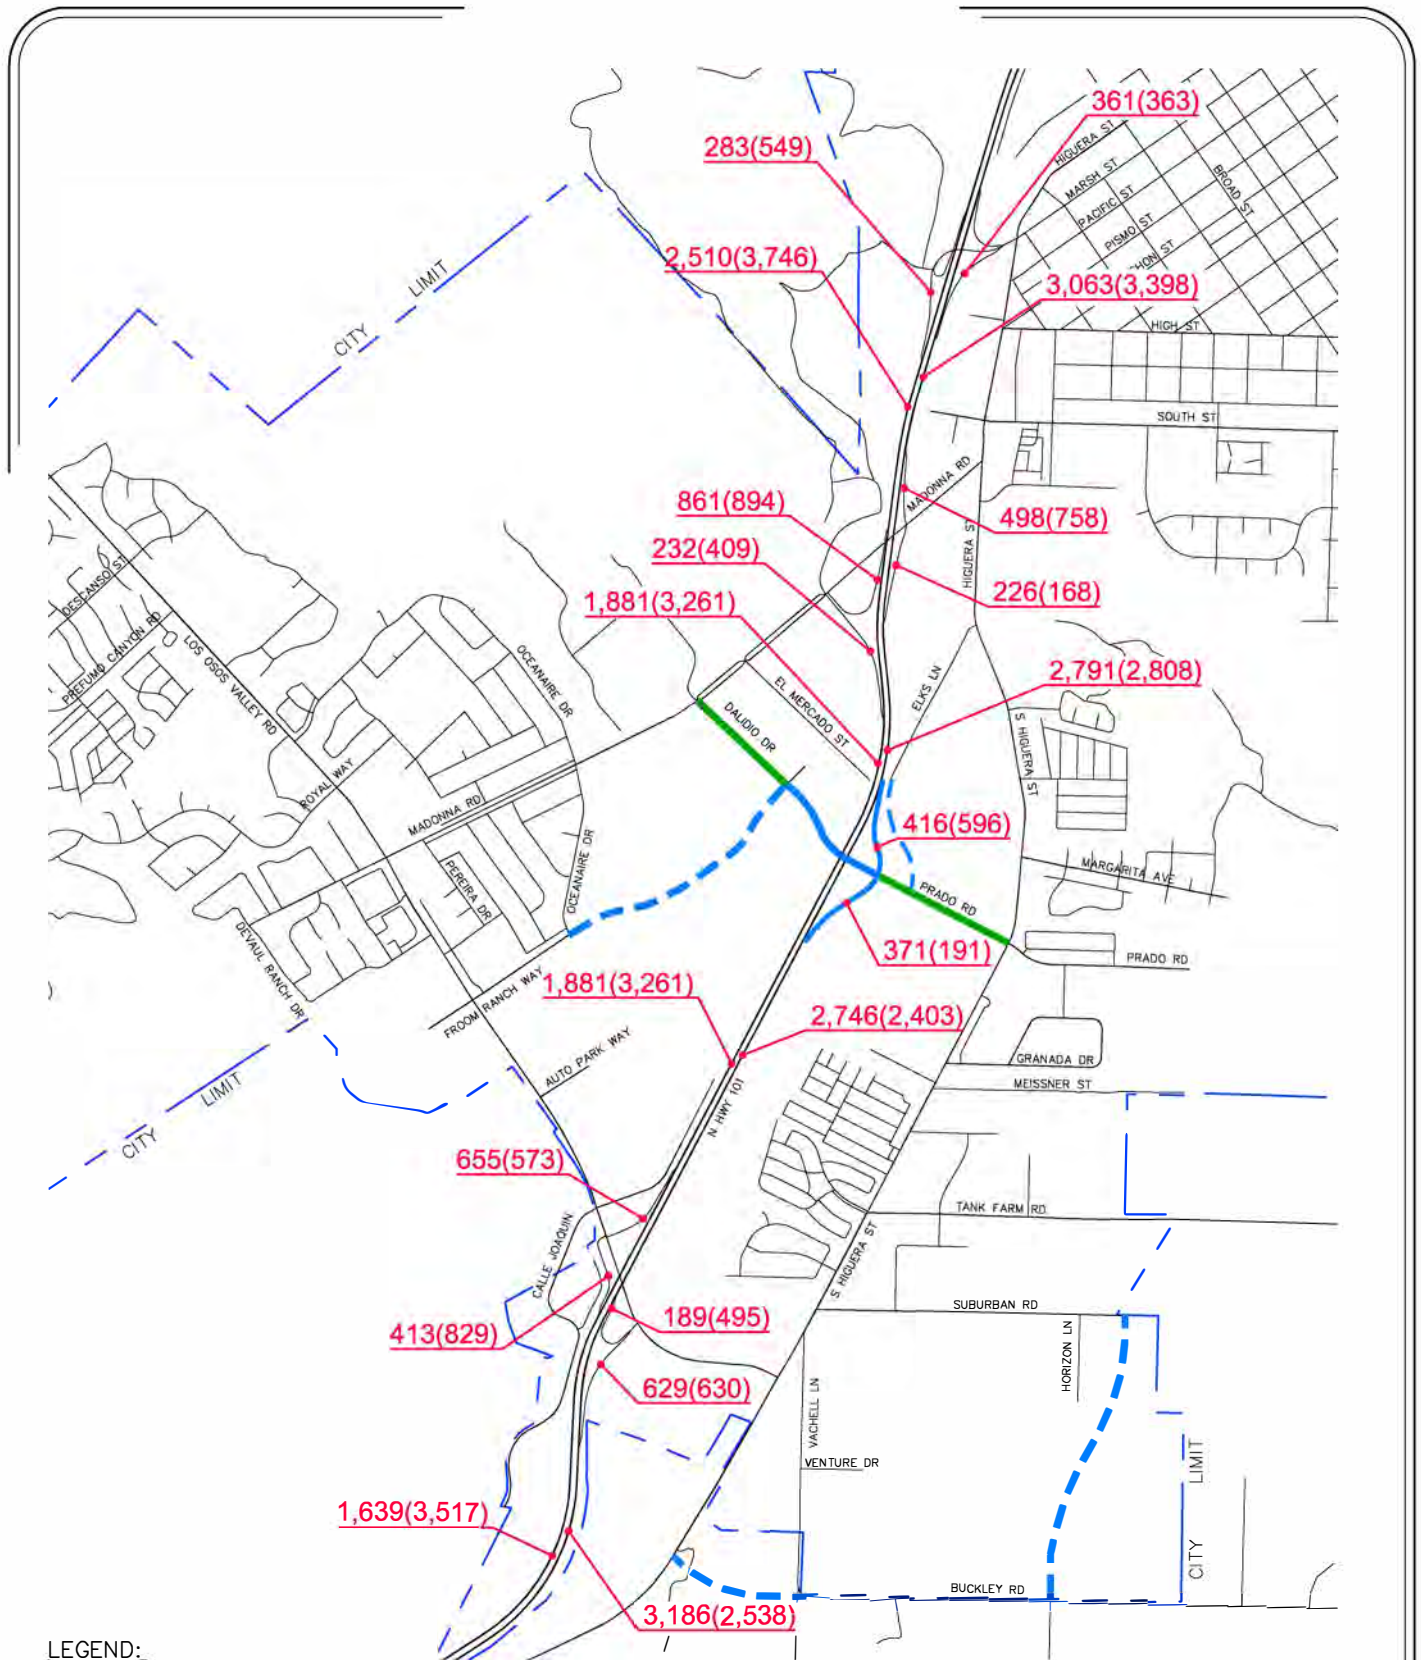

Near Term Plus Project Mitigation Measures

Based on the findings provided in the Final TIS, the Prado Road Overcrossing is required under the Existing Plus Project scenario, and the *Near Term* mitigation scenario assumes the Prado Overcrossing to be constructed. The US 101/Prado Road Interchange Project Study Report-Project Development Support (PSR-PDS) approved by Caltrans in April 2018 includes viable build alternatives each of which assumes that the Prado Road Overcrossing is constructed an open for use by the year 2025. In addition, each viable build alternative also assumes reconstruction of the northbound (NB) US 101/Prado Road on and off ramps and construction of an auxiliary lane between the NB Prado Road on-ramp and the off-ramp to Madonna Road. These additional improvements are assumed for the Near Term Plus Project Mitigation Measures conditions.

Figure 6 presents the Year 2025 Near Term Plus Project Mitigation US 101 mainline, ramp junctions, and weave sections peak hour traffic volumes.

Near Term Plus Project Mitigation Conditions Analysis

Table 10 provides a summary of the Near Term Plus Project Mitigation conditions US 101 mainline, ramp junction and weaving section operations during the AM and PM peak hour conditions. As shown in the table, all US 101 mainline, ramp merge and diverge, and weave sections are projected to operate at LOS D or better during both the AM and PM peak hours.

| US 101 SB South of Los Osos Valley Road | Freeway | 2 | 1,639 | 14.4 | B | 3,517 | 33.6 | D |

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 11. As shown in this table, the NB weave between Prado Road and Madonna Road is projected to improve at LOS C during both the AM and PM peak hours with the addition of the auxiliary lane. The addition of the auxiliary lane would also improve the Near Term No Project condition peak hour operations to LOS C. Table 11 also shows that the SB weave between Marsh Street and Madonna Road is still projected to operate at LOS E during the PM peak hour. This is also consistent with the Near Term No Project conditions peak hour operations reported in Table 7 and the Near Term Plus Project conditions peak hour operations reported in Table 9.

Cumulative Conditions (Year 2035)

Cumulative conditions establish the conditions that would exist due to the build-out of the City's General Plan, which is approximately twenty years out (Year 2035). A volume growth increment for all travel modes was developed and presented in the Final TIS for the Cumulative conditions using the San Luis Obispo City Travel Demand Model projections. Vehicular trips are determined using the City's TDM and assuming build-out of the City's General Plan without the development

of the proposed project's site; i.e. the land use totals in the project's Traffic Analysis Zone were zeroed out as to not double count site trip generation.

The City's buildout circulation system was assumed to be constructed for Cumulative conditions in the Final TIS, including the improvements listed in the Near Term conditions and the following improvements:

- A new North/South Collector between Prado Road and Tank Farm Road
- Prado Road extension to Broad Street
- Prado Road widening to four lanes with bike lanes between S. Higuera Street, and remove parking
- Madonna Road at S. Higuera Street realignment to Bridge Street
- New North/South Collector between Tank Farm Road and Prado Road
- Restrict intersection of S. Higuera Street/Vachell Lane to be right-in right-out only
- Froom Ranch Way extension to Dalidio Road
- Dalidio Road widening to 4 lanes with Class II Bike Lanes
- Prado Road Interchange configuration to be determined based on PSR work

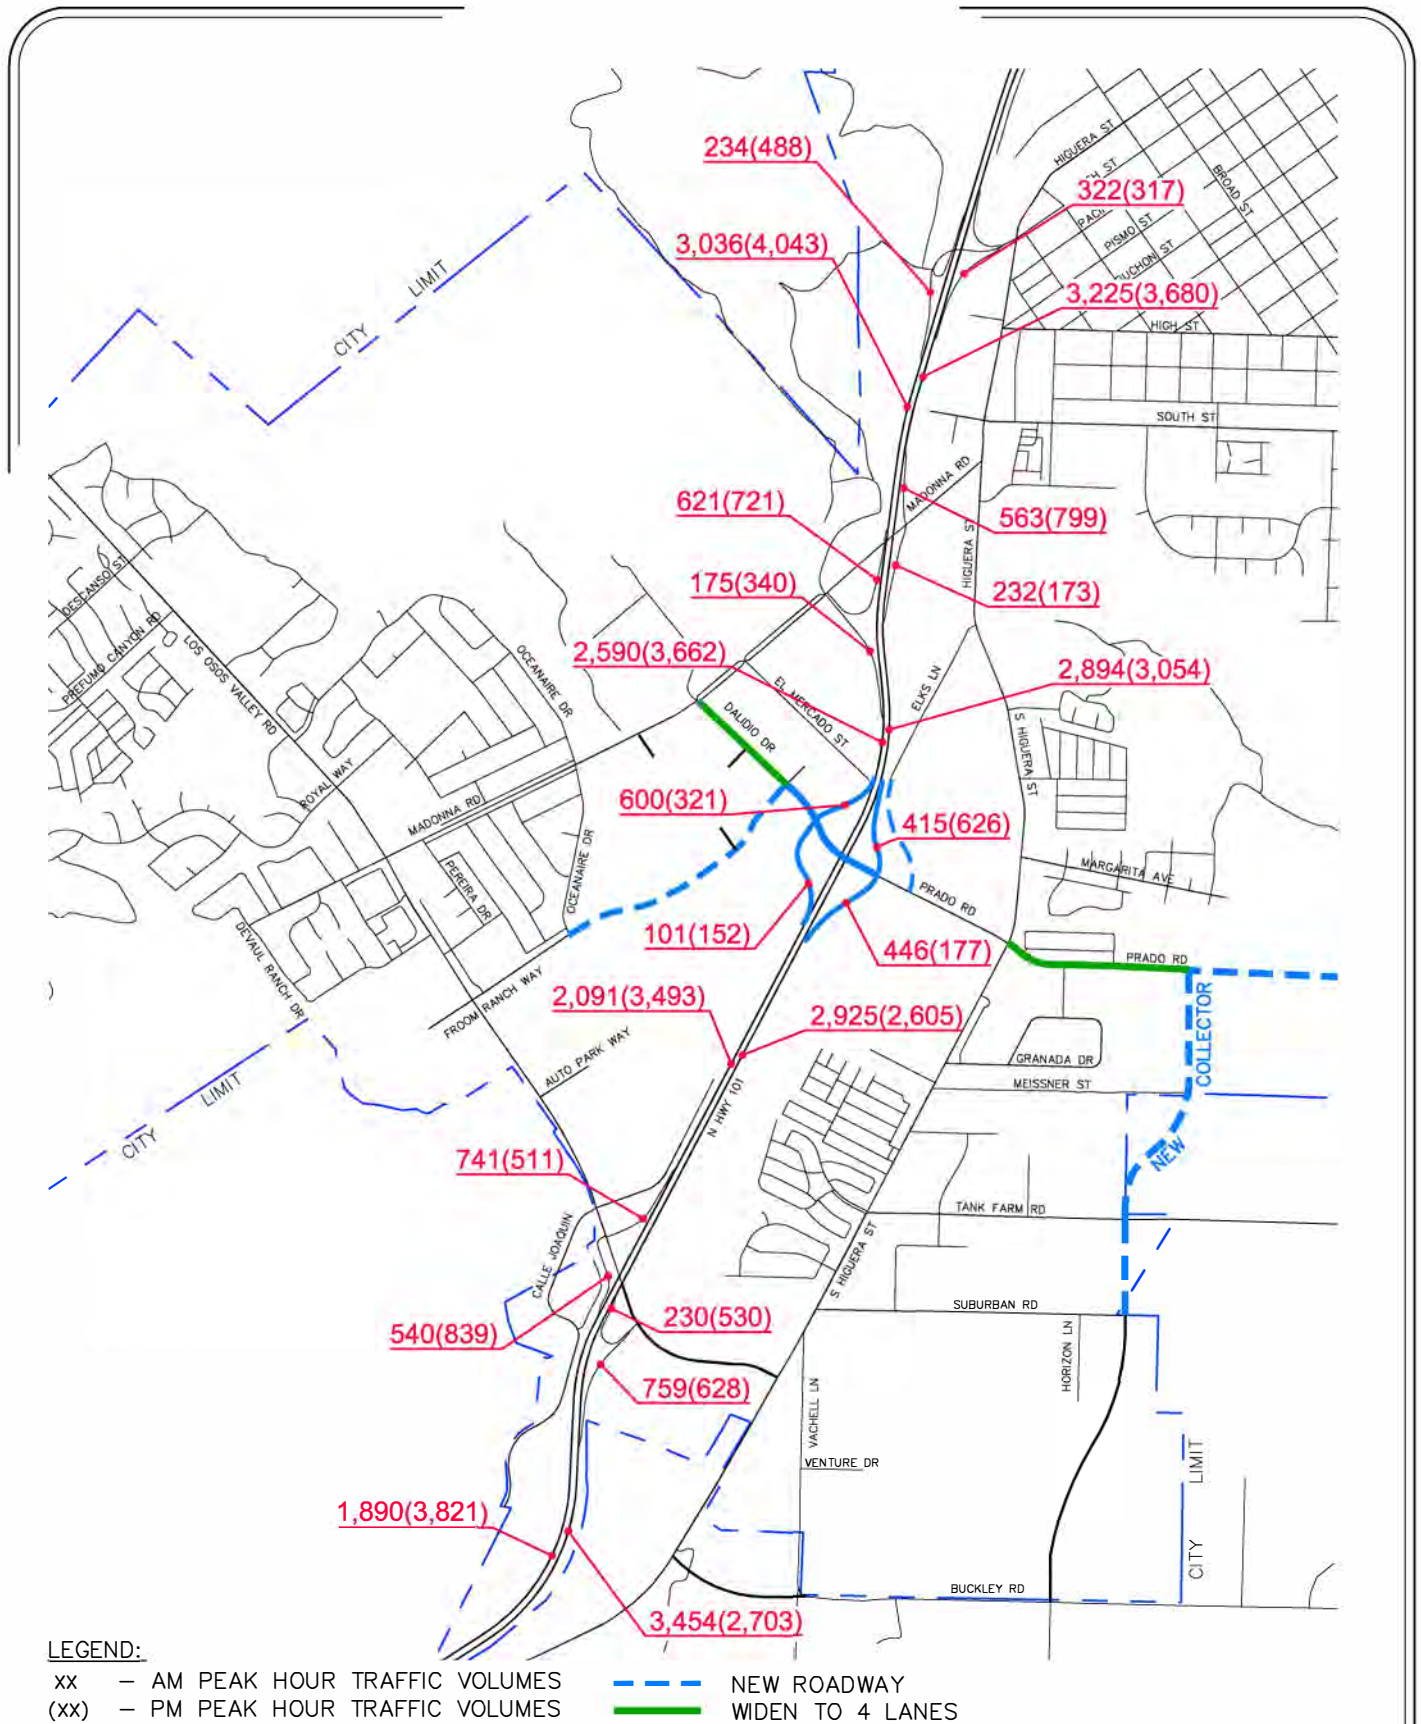

Prado Interchange and Overcrossing Scenarios

For the purposes of this Supplemental TIS, Cumulative conditions were analyzed for two different configurations for the Prado Road improvements consistent with the Final TIS: Full Build Prado Road Interchange and Prado Road Overcrossing scenarios. In addition, the Full Build Prado Road Interchange conditions assume provision of a NB US 101 auxiliary lane between the Prado Road on-ramp and the off-ramp to Madonna Road and a SB auxiliary lane between the Madonna Road on-ramp and the off-ramp to Dalidio/Prado. The peak hour traffic volumes for both scenarios were developed utilizing the City's TDM to establish the networks for the different alternatives, and used the same land use inputs for all alternatives.

As reported in the Final TIS, Cumulative traffic volume forecasts were derived for each alternative by applying the model's volume growth increment to the existing counts. The model's growth increment is based on the peak hour intersection turning outputs between the base year (2008) model and each of the 2035 buildout models, and factored to account for growth to existing conditions (2014). Based on existing travel patterns and counts, and to balance the volumes to account for midblock driveways, manual adjustments were made where necessary. This establishes the base forecasts for each alternative, without the San Luis Ranch development.

Year 2035 Full Build Prado Interchange Conditions

Consistent with the Final TIS, the base volumes (under the "Full Build" conditions analysis assume a full access diamond interchange for the purposes of this Supplemental TIS along with all other roadway improvements previously listed under the "Cumulative Conditions" section of this report. Figure 7 presents the Year 2035 Full Build Prado Road Interchange (no project) US 101 mainline, ramp junctions, and weave sections peak hour traffic volumes.

SAN LUIS RANCH SPECIFIC PLAN MULTIMODAL TIS

Figure 7

Year 2035 Full Build Prado Road Interchange US 101 Peak Hour Traffic Volumes

Year 2035 Full Build Prado Interchange Conditions Analysis

Table 12 provides a summary of the Year 2035 Full Build Prado Road Interchange conditions (no project) US 101 mainline, ramp junction and weaving section operations during the AM and PM peak hour conditions. As shown in the table, the US 101 NB diverge to Los Osos Valley Road is projected to operate at LOS E during the AM peak hour, the US 101 SB merge from Los Valley Road is projected to operate at LOS E during the PM peak Hour, and the US 101 SB mainline south of Los Osos Valley Road is projected to operate at LOS E during the PM peak hour. All other US 101 mainline, ramp merge and diverge, and weave sections are projected to operate at LOS D or better during both the AM and PM peak hours.

Year 2035 Full Build Prado Interchange Plus Project Conditions

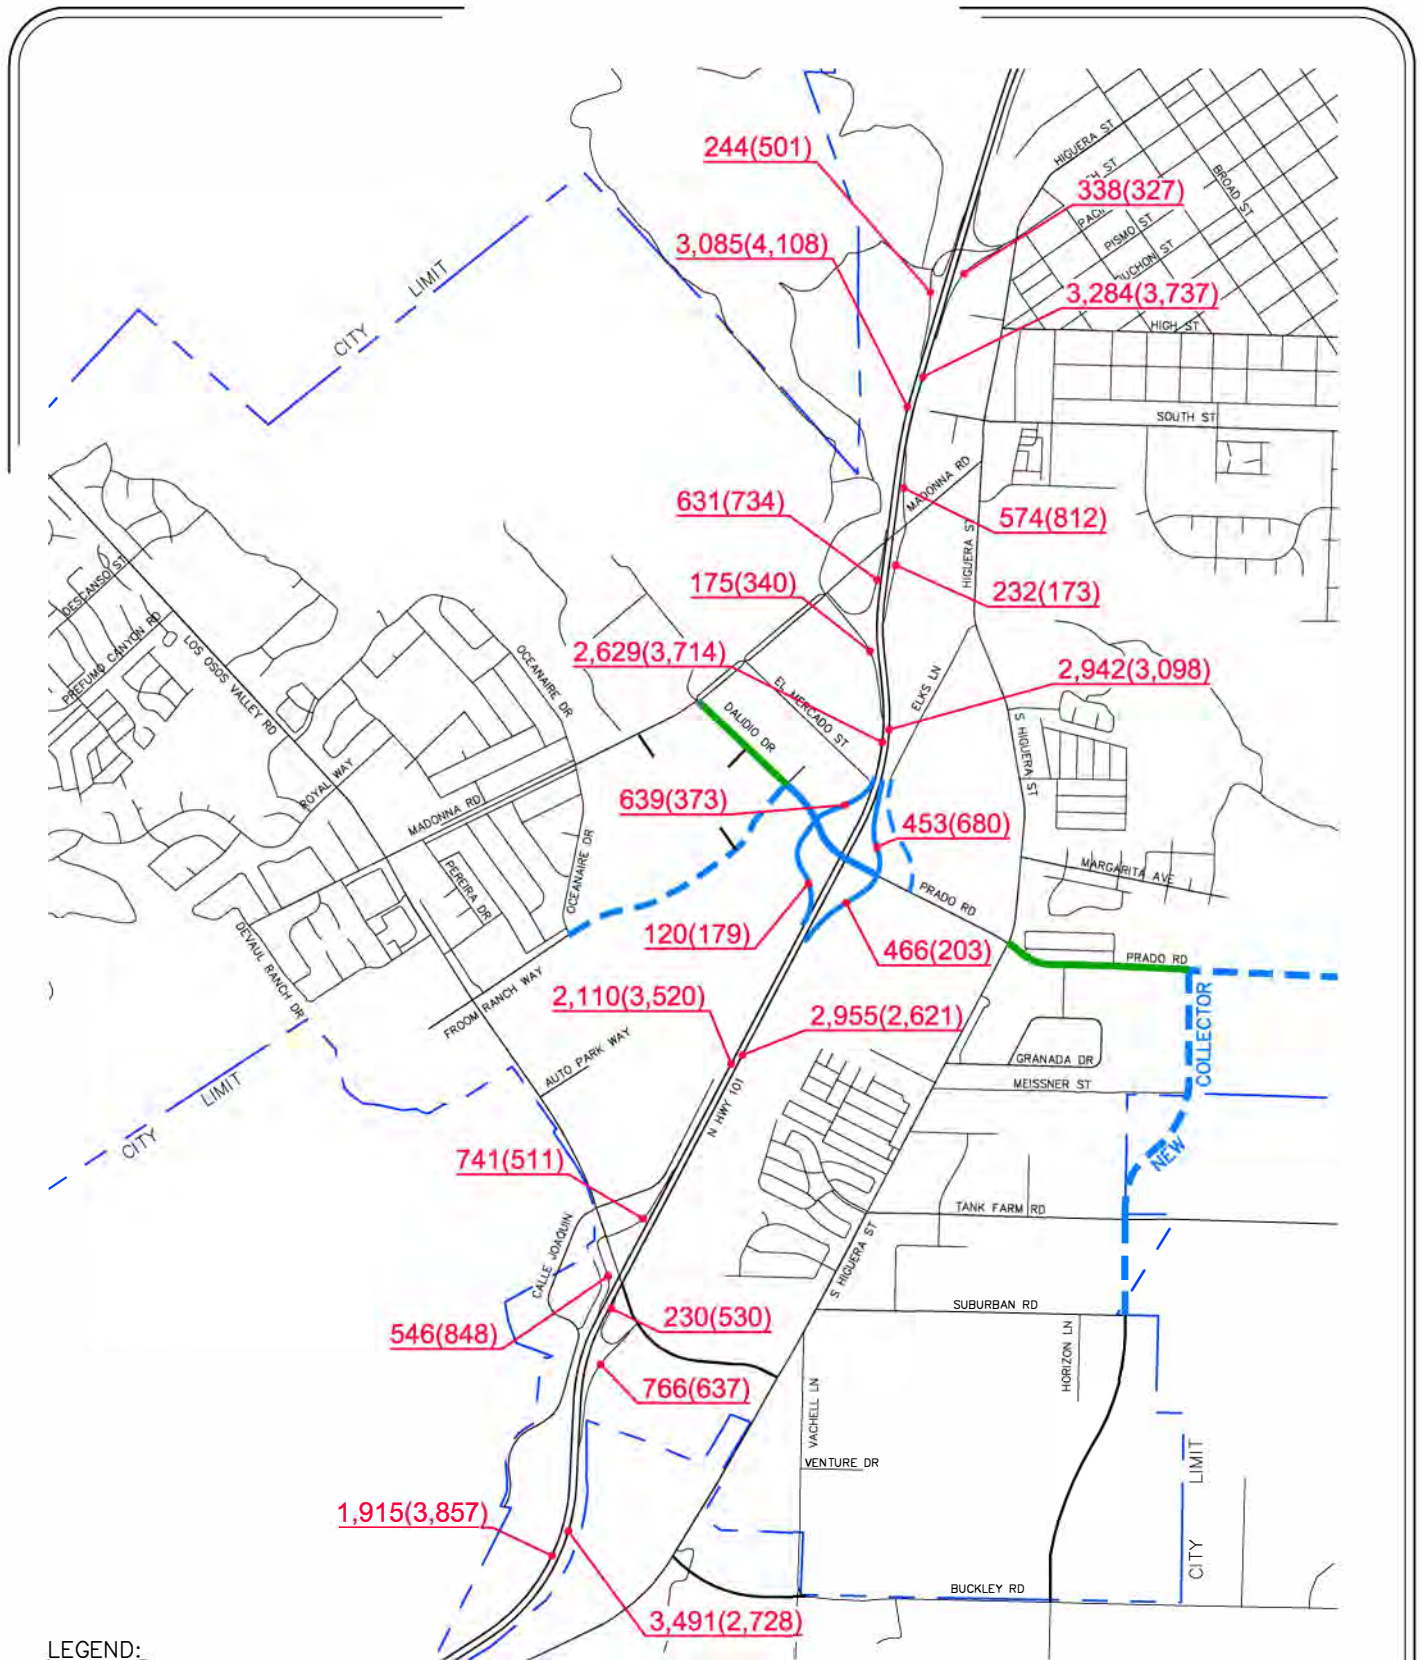

The project generated peak hour volumes have been added to the derived 2035 Full Build Prado Interchange volumes to obtain the Full Build Prado Interchange Plus Project conditions. Figure 8 presents the 2035 Full Build Prado Interchange Plus Project US 101 mainline, ramp junctions, and weave sections peak hour traffic volumes.

Year 2035 Full Build Prado Interchange Plus Project Conditions Analysis

Table 14 provides a summary of the Year 2035 Full Build Prado Interchange Plus Project US 101 mainline, ramp junction and weaving section operations during the AM and PM peak hour conditions. As shown in the table, the US 101 NB diverge to Los Osos Valley Road is projected to operate at LOS E during the AM peak hour, the US 101 SB merge from Los Valley Road is projected to operate at LOS E during the PM peak Hour, and the US 101 SB mainline south of Los Osos Valley Road is projected to operate at LOS E during the PM peak hour. The projected LOS E at these three locations and during these peak hour time periods are consistent with that reported for the Year 2035 Full Build Prado Interchange conditions. All other US 101 mainline, ramp merge and diverge, and weave sections are projected to operate at LOS D or better during both the AM and PM peak hours.

Figure 8

Year 2035 Full Build Prado Road Interchange Plus Project US 101 Peak Hour Traffic Volumes

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 15. As shown in this table, the SB weave between Marsh Street and Madonna Road is projected to operate at LOS E during the PM peak hour and the SB weave between Madonna Road and Dalidio/Prado is projected to operate at LOS E during the PM peak hour. The projected LOS E on both weave sections is consistent with that reported for the Year 2035 Full Build Prado Interchange conditions.

**TABLE 15:
YEAR 2035 FULL BUILD PRADO INTERCHANGE PLUS PROJECT CONDITIONS WEAVING SECTIONS –
LEISCH METHOD**

| Interchange Location | Target LOS | Segment Type | No. of Lanes | AM Peak Hour | | | PM Peak Hour | | |

Year 2035 Full Build Prado Interchange Plus Project Conditions Impacts Level of Significance

As previously noted for “Caltrans Significance Threshold”, based on standard industry practice the project is considered to have a significant impact if it would:

- Result in a facility that will operate at an acceptable LOS in the *No Project* condition to deteriorate to an unacceptable LOS in the *Plus Project* condition; or,
- Increase the density by more than 5% at a facility that will operate at an unacceptable LOS.

Both the Year 2035 Full Build Prado Road Interchange conditions and the Year 2035 Full Build Prado Road Interchange Plus Project conditions identified that the US 101 NB diverge to Los Osos Valley Road is projected to operate at LOS E during the AM peak hour, the US 101 SB merge from Los Valley Road is projected to operate at LOS E during the PM peak Hour, and the US 101 SB mainline south of Los Osos Valley Road is projected to operate at LOS E during the PM peak hour. For both conditions, these represent facilities that are projected to operate at an unacceptable LOS. Table 16 shows whether the addition of project traffic is projected to increase the density by more than 5% at any of the locations. As shown in the table, the addition of the project’s traffic would result in less than 1% increase in the density at any of the three locations

**TABLE 16:
YEAR 2035 FULL BUILD PRADO INTERCHANGE PLUS PROJECT CONDITIONS LEVEL OF SIGNIFICANCE**

| Location | Segment Type | No Project Condition | | Plus Project Condition | | % Increase |
|---|--------------|----------------------|----------------------|------------------------|----------------------|------------|

Year 2035 Prado Road Overcrossing Conditions

Consistent with the Final TIS, the base volumes under the “Overcrossing” conditions analysis assume a four-lane roadway between S. Higuera Street and Madonna Road for the purposes of this Supplemental TIS, with an overcrossing over US 101 and removal of the existing US 101 NB ramps at Prado Road, along with all other roadway improvements previously listed under the “Cumulative Conditions” section of this report. Figure 9 presents the Year 2035 Prado Road Overcrossing (no project) US 101 mainline, ramp junctions, and weave sections peak hour traffic volumes.

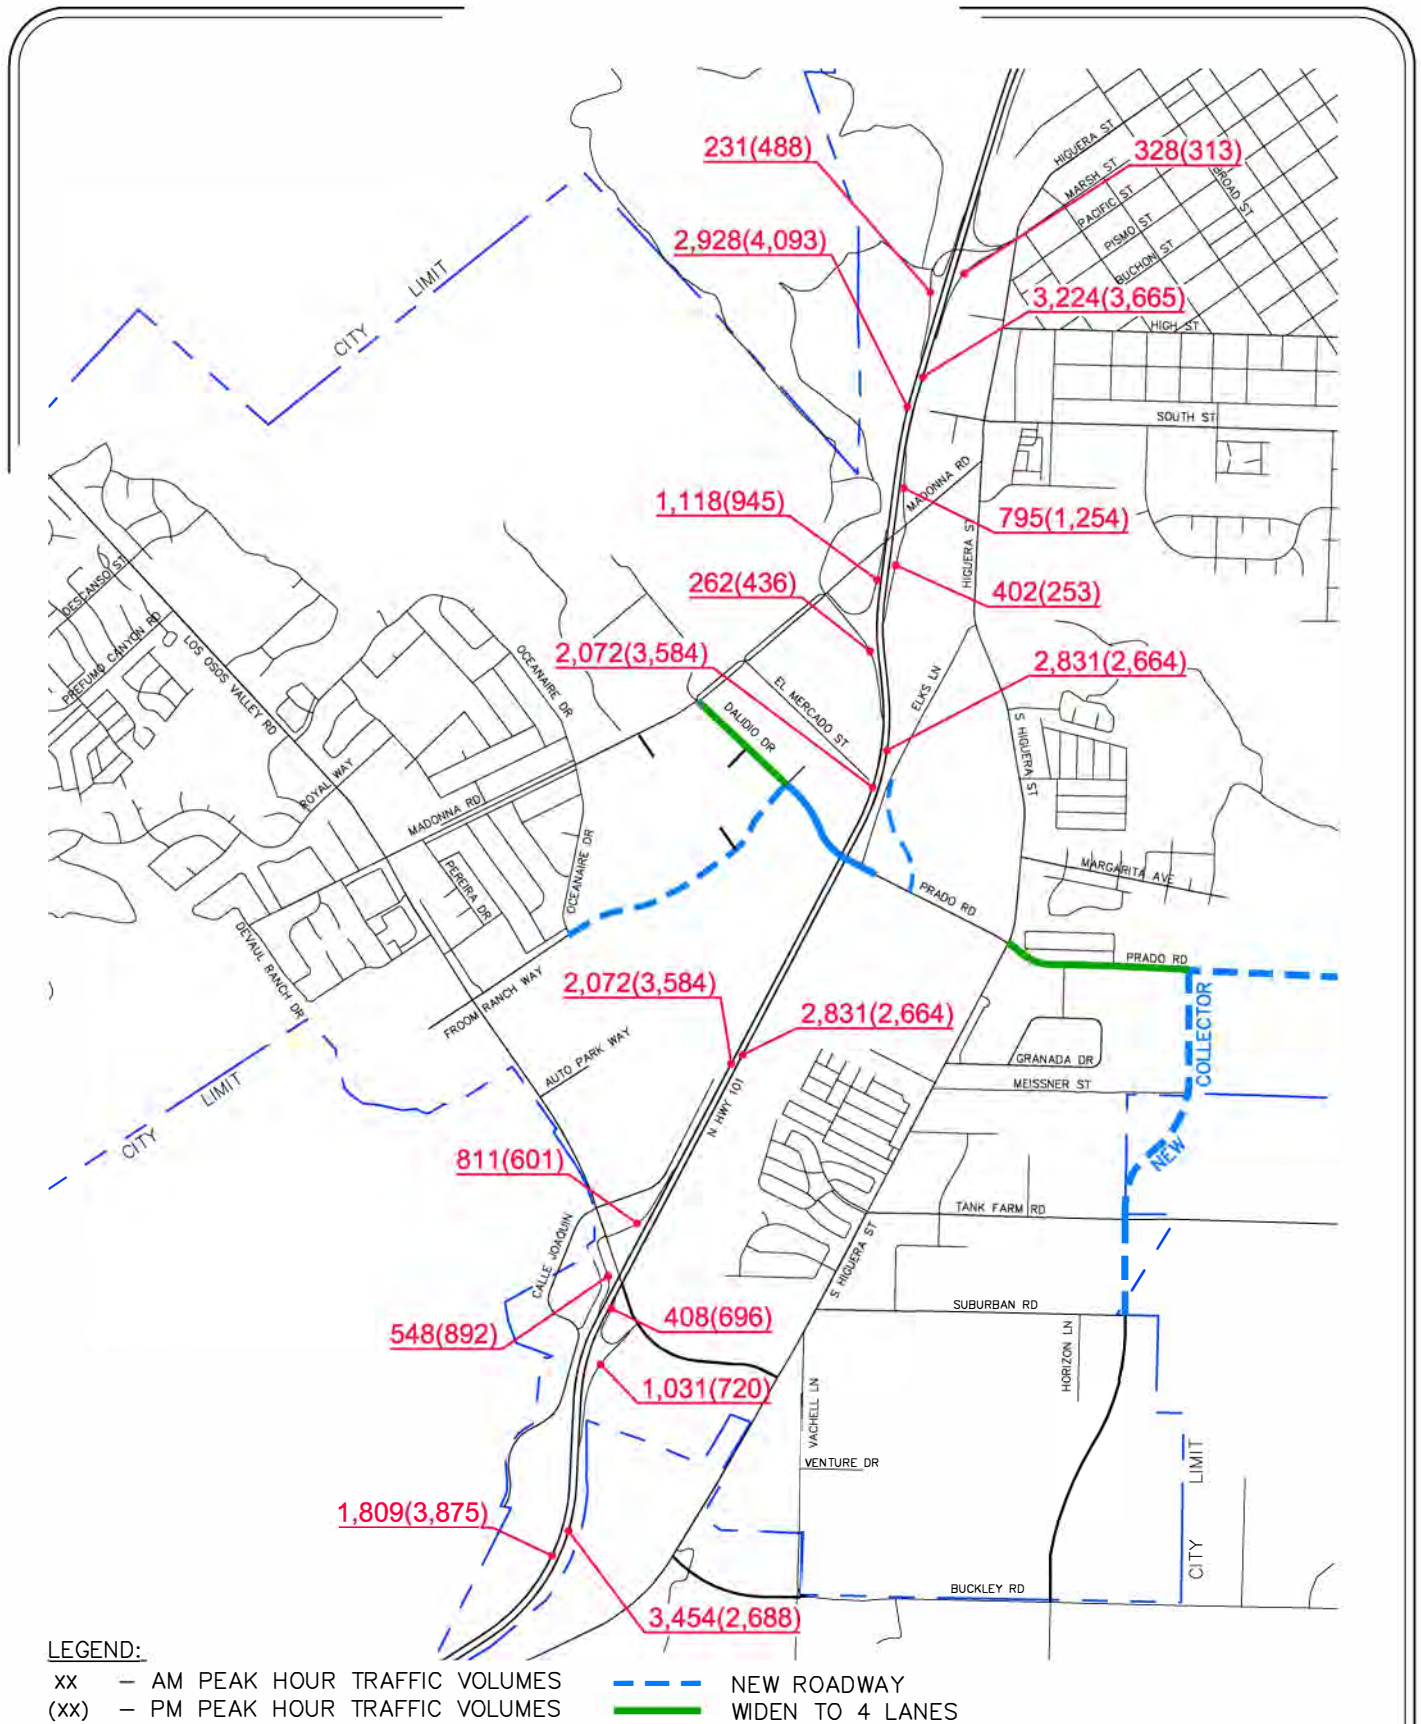

Year 2035 Prado Road Overcrossing Conditions Analysis

Table 17 provides a summary of the Year 2035 Prado Road Overcrossing US 101 mainline, ramp junction and weaving section operations during the AM and PM peak hour conditions. As shown in the table, the US 101 NB diverge to Los Osos Valley Road is projected to operate at LOS E during the AM peak hour, the US 101 SB merge from Los Valley Road is projected to operate at LOS E during the PM peak Hour, and the US 101 SB mainline south of Los Osos Valley Road is projected to operate at LOS E during the PM peak hour. The projected LOS E at these three locations and during these peak hour time periods are consistent with that reported for the Year 2035 Full Build Prado Interchange conditions. All other US 101 mainline, ramp merge and diverge, and weave sections are projected to operate at LOS D or better during both the AM and PM peak hours.

**TABLE 17:
YEAR 2035 PRADO ROAD OVERCROSSING CONDITIONS MAINLINE, RAMPS & WEAVING SECTIONS – HCS
2010 ANALYSIS**

| Interchange Location | Segment Type | No. of Lanes | AM Peak Hour | | | PM Peak Hour | | |

| US 101 SB South of Los Osos Valley Road | Freeway | 2 | 1,809 | 15.9 | B | 3,875 | 39.7 | E |

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 18. As shown in this table, the SB weave between Marsh Street and Madonna Road is projected to operate at LOS E during the PM peak hour. The projected LOS E is consistent with that reported for the Year 2035 Full Build Prado Interchange conditions.

Year 2035 Prado Road Overcrossing Plus Project Conditions

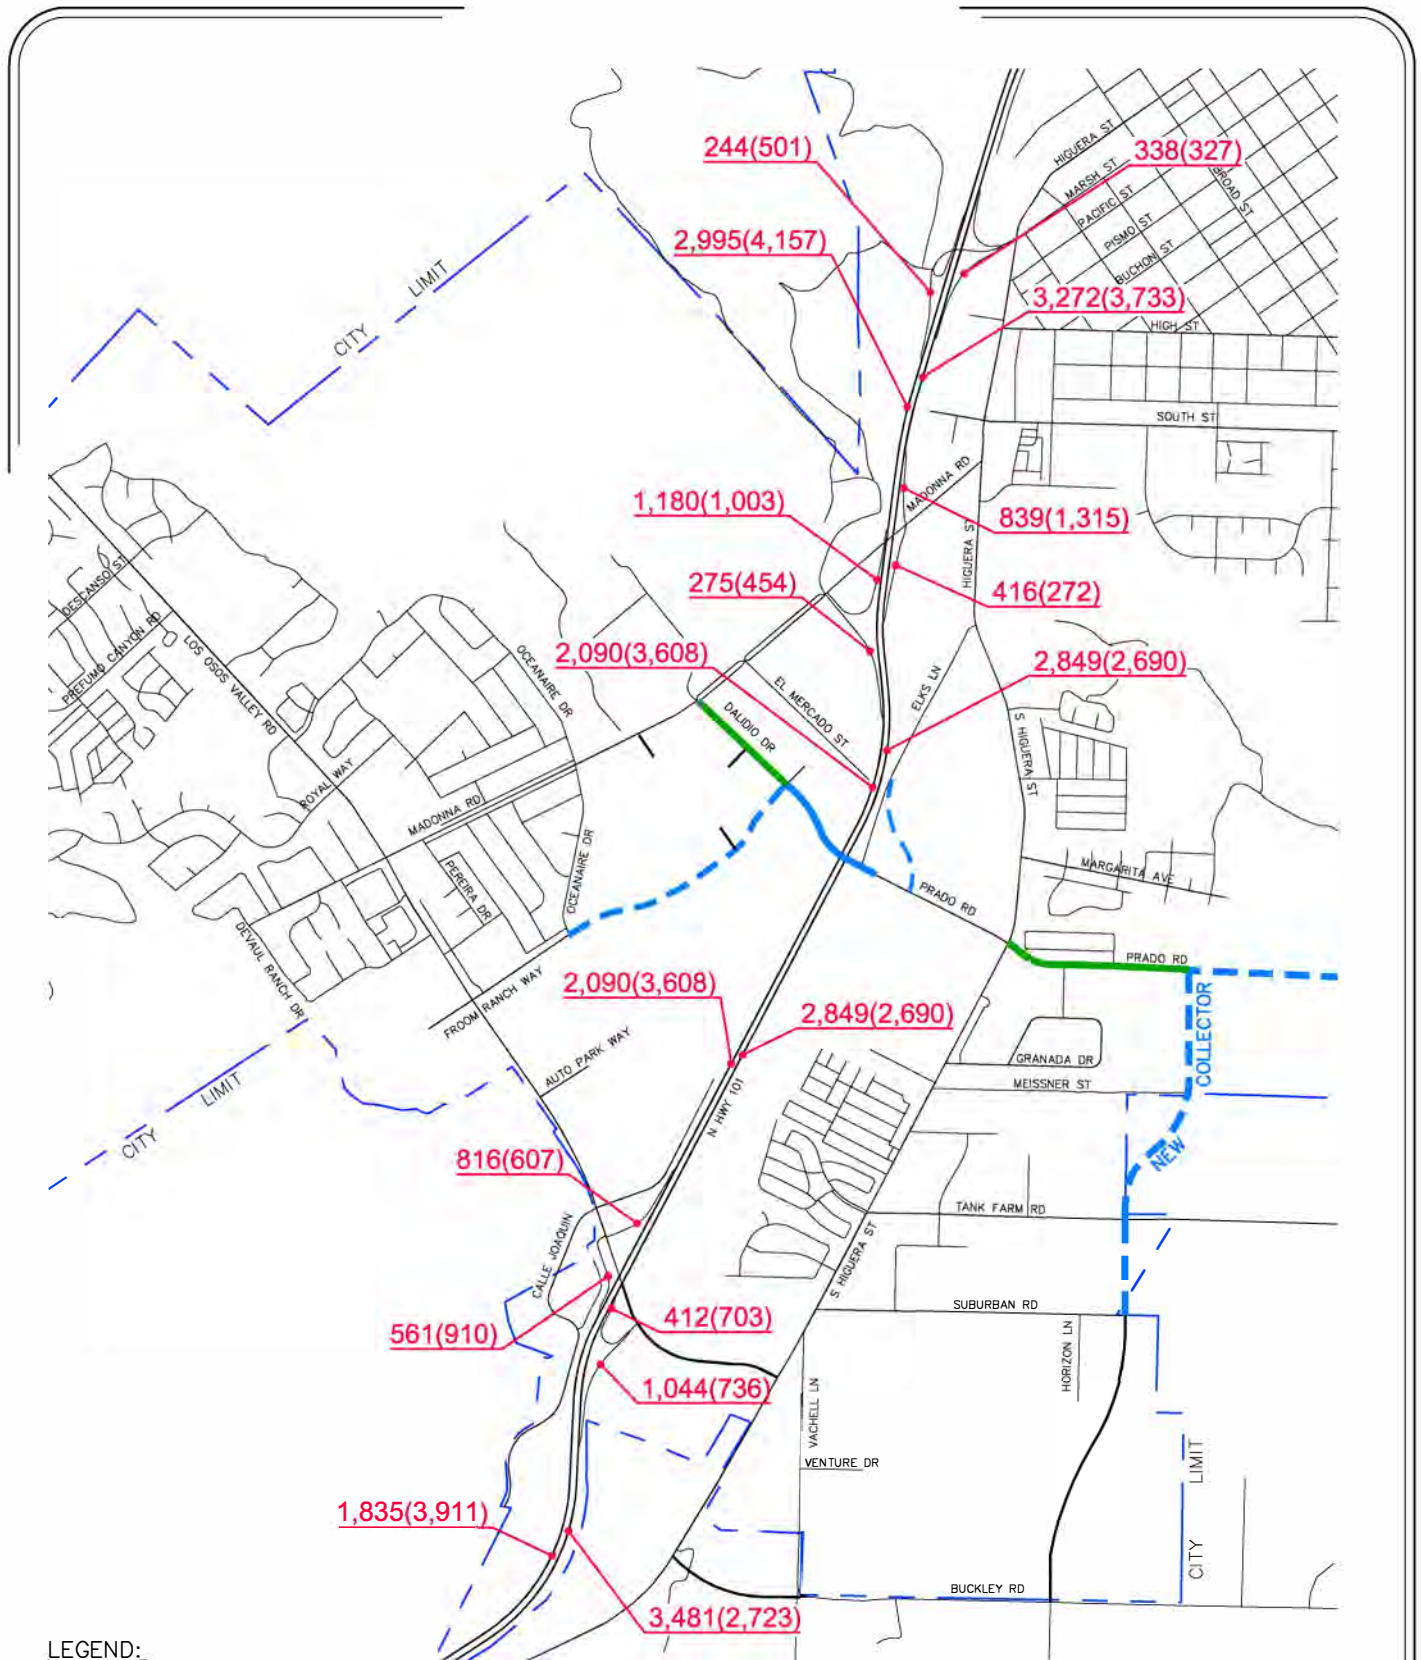

Consistent with the Final TIS, the project generated peak hour volume has been added to the derived 2035 Prado Road Overcrossing volumes to obtain the Year 2035 Prado Road Overcrossing Plus Project conditions. Figure 10 presents the Year 2035 Prado Road Overcrossing Plus Project US 101 mainline, ramp junctions, and weave sections peak hour traffic volumes.

Year 2035 Prado Road Overcrossing Plus Project Conditions Analysis

Table 19 provides a summary of the Year 2035 Prado Road Overcrossing freeway segments analysis for AM and PM peak hour conditions for the study segments along US 101. As shown in the table, the US 101 NB diverge to Los Osos Valley Road is projected to operate at LOS E during the AM peak hour, the US 101 SB merge from Los Valley Road is projected to operate at LOS E during the PM peak Hour, and the US 101 SB mainline south of Los Osos Valley Road is projected to operate at LOS E during the PM peak hour. The projected LOS E at these three locations and during these peak hour time periods are consistent with that reported for the Year 2035 Full Build Prado Interchange conditions. All other US 101 mainline, ramp merge and diverge, and weave sections are projected to operate at LOS D or better during both the AM and PM peak hours.

Figure 10

Year 2035 Overcrossing Plus Project US 101 Peak Hour Traffic Volumes

To supplement the HCS analysis, peak hour weaving section operations were also evaluated using the Leisch Method with these results provided in Table 20. As shown in this table, the SB weave between Marsh Street and Madonna Road is projected to operate at LOS E during the PM peak hour. The projected LOS E is consistent with that reported for the Year 2035 Full Build Prado Interchange conditions.

**TABLE 20:
YEAR 2035 PRADO ROAD OVERCROSSING PLUS PROJECT CONDITIONS WEAVING SECTIONS – LEISCH METHOD**

| Interchange Location | Segment Type | No. of Lanes | AM Peak Hour | | | PM Peak Hour | | |

Year 2035 Prado Road Overcrossing Plus Project Conditions Impacts Level of Significance

As previously noted for “Caltrans Significance Threshold”, based on standard industry practice the project is considered to have a significant impact if it would:

- Result in a facility that will operate at an acceptable LOS in the *No Project* condition to deteriorate to an unacceptable LOS in the *Plus Project* condition; or,
- Increase the density by more than 5% at a facility that will operate at an unacceptable LOS.

Both the Year 2035 Prado Road Overcrossing conditions and the Year 2035 Prado Road Overcrossing Plus Project conditions identified that the US 101 NB diverge to Los Osos Valley Road is projected to operate at LOS E during the AM peak hour, the US 101 SB merge from Los Valley Road is projected to operate at LOS E during the PM peak Hour, and the US 101 SB mainline south of Los Osos Valley Road is projected to operate at LOS E during the PM peak hour. For both conditions, these represent facilities that are projected to operate at an unacceptable LOS. Table 21 shows whether the addition of project traffic is projected to increase the density by more than 5% at any of the locations. As shown in the table, the addition of the project’s traffic would result in less than 1% increase in the density at any of the three locations

**TABLE 21:
YEAR 2035 FULL BUILD PRADO INTERCHANGE PLUS PROJECT CONDITIONS LEVEL OF SIGNIFICANCE**

| Volume ratio, VR | | 0.167 | | | |

Configuration Characteristics

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 67 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 1252 | lc/h |
| Total lane changes, LCALL | 1319 | lc/h |

Weaving and Non-Weaving Speeds

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.154 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.3 | mi/h |
| Average non-weaving speed, SNW | 58.3 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 58.3 | mi/h |
| Weaving segment density, D | 23.8 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.634 | |
| Weaving segment flow rate, v | 2779 | pc/h |
| Weaving segment capacity, cW | 4175 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4201 | 2140 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2192 | c |
| v/c ratio | | 1.00 | 0.634 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

-----Configuration Characteristics-----

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 67 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 1252 | lc/h |
| Total lane changes, LCALL | 1319 | lc/h |

-----Weaving and Non-Weaving Speeds-----

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.154 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.3 | mi/h |
| Average non-weaving speed, SNW | 58.3 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 58.3 | mi/h |
| Weaving segment density, D | 24.0 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.638 | |
| Weaving segment flow rate, v | 2795 | pc/h |
| Weaving segment capacity, cW | 4170 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4249 | 2140 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2189 | c |
| v/c ratio | | 1.00 | 0.638 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

| Driver population adjustment, fP | 1.00 | 1.00 | 1.00 | 1.00 | |
| Flow rate, v | 2002 | 442 | 245 | 111 | pc/h |
| Volume ratio, VR | | 0.245 | | | |

-----Configuration Characteristics-----

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 67 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 1210 | lc/h |
| Total lane changes, LCALL | 1277 | lc/h |

-----Weaving and Non-Weaving Speeds-----

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.150 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.5 | mi/h |
| Average non-weaving speed, SNW | 58.3 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 58.3 | mi/h |
| Weaving segment density, D | 24.0 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.657 | |
| Weaving segment flow rate, v | 2800 | pc/h |
| Weaving segment capacity, cW | 4059 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 5005 | 2140 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2131 | c |
| v/c ratio | | 1.00 | 0.657 | d |

Notes:

- a. In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- b. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- c. The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- d. Volumes exceed the weaving segment capacity. The level of service is F.

-----Configuration Characteristics-----

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 67 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 1307 | lc/h |
| Total lane changes, LCALL | 1374 | lc/h |

-----Weaving and Non-Weaving Speeds-----

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.159 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.1 | mi/h |
| Average non-weaving speed, SNW | 57.6 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 57.7 | mi/h |
| Weaving segment density, D | 26.8 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.706 | |
| Weaving segment flow rate, v | 3096 | pc/h |
| Weaving segment capacity, cW | 4177 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4192 | 2140 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2193 | c |
| v/c ratio | | 1.00 | 0.706 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

| Volume ratio, VR | | 0.224 | | | |

Configuration Characteristics

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 113 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 697 | lc/h |
| Total lane changes, LCALL | 810 | lc/h |

Weaving and Non-Weaving Speeds

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.153 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.4 | mi/h |
| Average non-weaving speed, SNW | 59.5 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 59.2 | mi/h |
| Weaving segment density, D | 19.5 | pc/mi/ln |
| Level of service, LOS | B | |
| Weaving segment v/c ratio | 0.554 | |
| Weaving segment flow rate, v | 3464 | pc/h |
| Weaving segment capacity, cW | 5960 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4783 | 1330 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2086 | c |
| v/c ratio | | 1.00 | 0.554 | d |

Notes:

- a. In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- b. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- c. The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- d. Volumes exceed the weaving segment capacity. The level of service is F.

| Heavy vehicle adjustment, fHV | 0.952 | 0.952 | 0.952 | 0.952 | |
| Driver population adjustment, fP | 1.00 | 1.00 | 1.00 | 1.00 | |
| Flow rate, v | 2509 | 292 | 238 | 73 | pc/h |
| Volume ratio, VR | | 0.170 | | | |

Configuration Characteristics

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 67 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 1307 | lc/h |
| Total lane changes, LCALL | 1374 | lc/h |

Weaving and Non-Weaving Speeds

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.159 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.1 | mi/h |
| Average non-weaving speed, SNW | 57.5 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 57.6 | mi/h |
| Weaving segment density, D | 27.0 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.711 | |
| Weaving segment flow rate, v | 3112 | pc/h |
| Weaving segment capacity, cW | 4171 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4235 | 2140 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2190 | c |
| v/c ratio | | 1.00 | 0.711 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

| Non-weaving lane change, LCNW | 697 | lc/h |
| Total lane changes, LCALL | 810 | lc/h |

-----Weaving and Non-Weaving Speeds-----

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.153 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.4 | mi/h |
| Average non-weaving speed, SNW | 59.0 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 58.8 | mi/h |
| Weaving segment density, D | 21.3 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.614 | |
| Weaving segment flow rate, v | 3754 | pc/h |
| Weaving segment capacity, cW | 5820 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 5415 | 1330 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2037 | c |
| v/c ratio | | 1.00 | 0.614 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

| Flow rate, v | 2400 | 465 | 252 | 0 | pc/h |
| Volume ratio, VR | | 0.230 | | | |

-----Configuration Characteristics-----

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 89 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 426 | lc/h |
| Total lane changes, LCALL | 515 | lc/h |

-----Weaving and Non-Weaving Speeds-----

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.141 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.8 | mi/h |
| Average non-weaving speed, SNW | 60.0 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 59.7 | mi/h |
| Weaving segment density, D | 17.4 | pc/mi/ln |
| Level of service, LOS | B | |
| Weaving segment v/c ratio | 0.507 | |
| Weaving segment flow rate, v | 3117 | pc/h |
| Weaving segment capacity, cW | 5860 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4846 | 940 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2051 | c |
| v/c ratio | | 1.00 | 0.507 | d |

Notes:

- a. In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- b. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- c. The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- d. Volumes exceed the weaving segment capacity. The level of service is F.

| Weaving intensity factor, W | 0.130 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 59.2 | mi/h |
| Average non-weaving speed, SNW | 60.5 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 60.0 | mi/h |
| Weaving segment density, D | 15.6 | pc/mi/ln |
| Level of service, LOS | B | |
| Weaving segment v/c ratio | 0.480 | |
| Weaving segment flow rate, v | 2804 | pc/h |
| Weaving segment capacity, cW | 5559 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 6807 | 2065 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 1987 | c |
| v/c ratio | | 1.00 | 0.480 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

Operational Analysis

Analyst: JAV
 Agency/Co.: Omni-Means, a GHD Company
 Date Performed: 3/16/2018
 Analysis Time Period: AM Peak
 Freeway/Dir of Travel: US 101 NB
 Weaving Location: Prado-Madonna
 Analysis Year: 2035 Full Build
 Description: San Luis Ranch Specific Plan Multimodal TIS

Inputs

| | | |
|--------------------------------|-----------|---------|
| Segment Type | Freeway | |
| Weaving configuration | One-Sided | |
| Number of lanes, N | 3 | ln |
| Weaving segment length, LS | 940 | ft |
| Freeway free-flow speed, FFS | 65 | mi/h |
| Minimum segment speed, SMIN | 15 | mi/h |
| Freeway maximum capacity, cIFL | 2350 | pc/h/ln |
| Terrain type | Level | |
| Grade | 0.00 | % |
| Length | 0.00 | mi |

Conversion to pc/h Under Base Conditions

| | Volume Components | | | | veh/h |
|----------------------------------|-------------------|-------|-------|-------|-------|
| | VFF | VRF | VFR | VRR | |
| Volume, V | 2247 | 415 | 232 | 0 | |
| Peak hour factor, PHF | 0.94 | 0.94 | 0.94 | 0.94 | |
| Peak 15-min volume, v15 | 598 | 110 | 62 | 0 | |
| Trucks and buses | 10 | 10 | 10 | 10 | % |
| Recreational vehicles | 0 | 0 | 0 | 0 | % |
| Trucks and buses PCE, ET | 1.5 | 1.5 | 1.5 | 1.5 | |
| Recreational vehicle PCE, ER | 1.2 | 1.2 | 1.2 | 1.2 | |
| Heavy vehicle adjustment, fHV | 0.952 | 0.952 | 0.952 | 0.952 | |
| Driver population adjustment, fP | 1.00 | 1.00 | 1.00 | 1.00 | |
| Flow rate, v | 2510 | 464 | 259 | 0 | pc/h |
| Volume ratio, VR | | 0.224 | | | |

Configuration Characteristics

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 89 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 449 | lc/h |
| Total lane changes, LCALL | 538 | lc/h |

Weaving and Non-Weaving Speeds

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.146 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.6 | mi/h |
| Average non-weaving speed, SNW | 59.8 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 59.6 | mi/h |
| Weaving segment density, D | 18.1 | pc/mi/ln |
| Level of service, LOS | B | |
| Weaving segment v/c ratio | 0.524 | |
| Weaving segment flow rate, v | 3233 | pc/h |
| Weaving segment capacity, cW | 5874 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4779 | 940 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2056 | c |
| v/c ratio | | 1.00 | 0.524 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 5061 | 2065 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2121 | c |
| v/c ratio | | 1.00 | 0.710 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

 Description: San Luis Ranch Specific Plan Multimodal TIS

Inputs

| | | |
|--------------------------------|-----------|---------|
| Segment Type | Freeway | |
| Weaving configuration | One-Sided | |
| Number of lanes, N | 3 | ln |
| Weaving segment length, LS | 940 | ft |
| Freeway free-flow speed, FFS | 65 | mi/h |
| Minimum segment speed, SMIN | 15 | mi/h |
| Freeway maximum capacity, cIFL | 2350 | pc/h/ln |
| Terrain type | Level | |
| Grade | 0.00 | % |
| Length | 0.00 | mi |

Conversion to pc/h Under Base Conditions

| | Volume Components | | | | veh/h |
|----------------------------------|-------------------|-------|-------|-------|-------|
| | VFF | VRF | VFR | VRR | |
| Volume, V | 2257 | 453 | 232 | 0 | |
| Peak hour factor, PHF | 0.94 | 0.94 | 0.94 | 0.94 | |
| Peak 15-min volume, v15 | 600 | 120 | 62 | 0 | |
| Trucks and buses | 10 | 10 | 10 | 10 | % |
| Recreational vehicles | 0 | 0 | 0 | 0 | % |
| Trucks and buses PCE, ET | 1.5 | 1.5 | 1.5 | 1.5 | |
| Recreational vehicle PCE, ER | 1.2 | 1.2 | 1.2 | 1.2 | |
| Heavy vehicle adjustment, fHV | 0.952 | 0.952 | 0.952 | 0.952 | |
| Driver population adjustment, fP | 1.00 | 1.00 | 1.00 | 1.00 | |
| Flow rate, v | 2521 | 506 | 259 | 0 | pc/h |
| Volume ratio, VR | | 0.233 | | | |

Configuration Characteristics

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 89 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 451 | lc/h |
| Total lane changes, LCALL | 540 | lc/h |

Weaving and Non-Weaving Speeds

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.146 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.6 | mi/h |
| Average non-weaving speed, SNW | 59.7 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 59.5 | mi/h |
| Weaving segment density, D | 18.4 | pc/mi/ln |
| Level of service, LOS | B | |
| Weaving segment v/c ratio | 0.535 | |
| Weaving segment flow rate, v | 3286 | pc/h |
| Weaving segment capacity, cW | 5854 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4874 | 940 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2049 | c |
| v/c ratio | | 1.00 | 0.535 | d |

Notes:

- a. In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- b. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- c. The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- d. Volumes exceed the weaving segment capacity. The level of service is F.

| Weaving segment v/c ratio | 0.542 | |
| Weaving segment flow rate, v | 3446 | pc/h |
| Weaving segment capacity, cW | 6057 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 5074 | 2065 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2120 | c |
| v/c ratio | | 1.00 | 0.542 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

 Analysis Time Period: AM Peak
 Freeway/Dir of Travel: US 101 NB
 Weaving Location: Madonna-Marsh
 Analysis Year: 2035 OC
 Description: San Luis Ranch Specific Plan Multimodal TIS

Inputs

| | | |
|--------------------------------|-----------|---------|
| Segment Type | Freeway | |
| Weaving configuration | One-Sided | |
| Number of lanes, N | 3 | ln |
| Weaving segment length, LS | 1330 | ft |
| Freeway free-flow speed, FFS | 65 | mi/h |
| Minimum segment speed, SMIN | 15 | mi/h |
| Freeway maximum capacity, cIFL | 2350 | pc/h/ln |
| Terrain type | Level | |
| Grade | 0.00 | % |
| Length | 0.00 | mi |

Conversion to pc/h Under Base Conditions

| | Volume Components | | | | veh/h |
|----------------------------------|-------------------|-------|-------|-------|-------|
| | VFF | VRF | VFR | VRR | |
| Volume, V | 2268 | 628 | 161 | 167 | |
| Peak hour factor, PHF | 0.94 | 0.94 | 0.94 | 0.94 | |
| Peak 15-min volume, v15 | 603 | 167 | 43 | 44 | |
| Trucks and buses | 10 | 10 | 10 | 10 | % |
| Recreational vehicles | 0 | 0 | 0 | 0 | % |
| Trucks and buses PCE, ET | 1.5 | 1.5 | 1.5 | 1.5 | |
| Recreational vehicle PCE, ER | 1.2 | 1.2 | 1.2 | 1.2 | |
| Heavy vehicle adjustment, fHV | 0.952 | 0.952 | 0.952 | 0.952 | |
| Driver population adjustment, fP | 1.00 | 1.00 | 1.00 | 1.00 | |
| Flow rate, v | 2533 | 701 | 180 | 187 | pc/h |
| Volume ratio, VR | | 0.245 | | | |

Configuration Characteristics

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 113 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 703 | lc/h |
| Total lane changes, LCALL | 816 | lc/h |

Weaving and Non-Weaving Speeds

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.154 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.3 | mi/h |
| Average non-weaving speed, SNW | 59.2 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 59.0 | mi/h |
| Weaving segment density, D | 20.3 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.580 | |
| Weaving segment flow rate, v | 3601 | pc/h |
| Weaving segment capacity, cW | 5911 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 4998 | 1330 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2069 | c |
| v/c ratio | | 1.00 | 0.580 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

Notes:

- a. In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- b. Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- c. The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- d. Volumes exceed the weaving segment capacity. The level of service is F.

| Volume ratio, VR | | 0.252 | | | |

Configuration Characteristics

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 113 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 706 | lc/h |
| Total lane changes, LCALL | 819 | lc/h |

Weaving and Non-Weaving Speeds

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.154 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.3 | mi/h |
| Average non-weaving speed, SNW | 59.2 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 58.9 | mi/h |
| Weaving segment density, D | 20.7 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.591 | |
| Weaving segment flow rate, v | 3656 | pc/h |
| Weaving segment capacity, cW | 5894 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 5077 | 1330 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 2063 | c |
| v/c ratio | | 1.00 | 0.591 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.

| Heavy vehicle adjustment, fHV | 0.952 | 0.952 | 0.952 | 0.952 | |
| Driver population adjustment, fP | 1.00 | 1.00 | 1.00 | 1.00 | |
| Flow rate, v | 2539 | 1266 | 162 | 203 | pc/h |
| Volume ratio, VR | | 0.342 | | | |

-----Configuration Characteristics-----

| | | |
|-------------------------------------|------|--------|
| Number of maneuver lanes, NWL | 2 | ln |
| Interchange density, ID | 0.00 | int/mi |
| Minimum RF lane changes, LCRF | 0 | lc/pc |
| Minimum FR lane changes, LCFR | 0 | lc/pc |
| Minimum RR lane changes, LCRR | | lc/pc |
| Minimum weaving lane changes, LCMIN | 0 | lc/h |
| Weaving lane changes, LCW | 113 | lc/h |
| Non-weaving vehicle index, INW | 0 | |
| Non-weaving lane change, LCNW | 708 | lc/h |
| Total lane changes, LCALL | 821 | lc/h |

-----Weaving and Non-Weaving Speeds-----

| | |
|-----------------------------|-------|
| Weaving intensity factor, W | 0.154 |
|-----------------------------|-------|

| | | |
|--------------------------------|------|------|
| Average weaving speed, SW | 58.3 | mi/h |
| Average non-weaving speed, SNW | 58.3 | mi/h |

_____Weaving Segment Speed, Density, Level of Service and Capacity_____

| | | |
|------------------------------|-------|----------|
| Weaving segment speed, S | 58.3 | mi/h |
| Weaving segment density, D | 23.8 | pc/mi/ln |
| Level of service, LOS | C | |
| Weaving segment v/c ratio | 0.699 | |
| Weaving segment flow rate, v | 4170 | pc/h |
| Weaving segment capacity, cW | 5683 | veh/h |

_____Limitations on Weaving Segments_____

If limit reached, see note.

| | Minimum | Maximum | Actual | Note |
|--|---------|---------|--------|------|
| Weaving length (ft) | 300 | 6044 | 1330 | a,b |
| Density-based capacity, cIWL (pc/h/ln) | | 2350 | 1989 | c |
| v/c ratio | | 1.00 | 0.699 | d |

Notes:

- In weaving segments shorter than 300 ft, weaving vehicles are assumed to make only necessary lane changes.
- Weaving segments longer than the calculated maximum length should be treated as isolated merge and diverge areas using the procedures of Chapter 13, "Freeway Merge and Diverge Segments."
- The density-based capacity exceeds the capacity of a basic freeway segment, under equivalent ideal conditions.
- Volumes exceed the weaving segment capacity. The level of service is F.
